About This Installation Guide

This Installation Guide offers you a complete description of how to install the IntelliTune server and client.

Keyboard Conventions

All key names are shown in capital letters. For example, the Control key is shown as CTRL.

Keys are frequently used in combinations or sequences as shortcut keys. For example, SHIFT+F3 means to hold down the SHIFT key while pressing F3.

Mouse Conventions

To Do this

Click Point to an item, and then quickly press and release the mouse button without moving the mouse.

Double-click Point to an item, and then quickly press and release the mouse button twice.

Context-click on Windows Click the right mouse button.

Context-click on Macintosh Hold down the CTRL key while clicking the mouse button.

Drag Point to an item. Press and hold down the mouse button as you move the mouse to a new location, then release the mouse button.

1 :Arkitex Installation and Setup

1.1 System Requirements

- The minimum requirements for the IntelliTune server (and for additional processing servers) and for IntelliTune client are:

- ☐ Server - Intel PC Platform

Dual Processor 3.2 GHz

2 GBytes RAM or greater *

80+ GBytes hard disk space available

Operating System:

Windows Server 2008 R2

64-bit

Windows Server 2012

64-bit

Windows 7 Professional

32- or 64-bit

Windows 8 Professional

32- or 64-bit

*(Microsoft© recommendations at MSDN.Microsoft.com)

- ☐ Client - Intel PC Platform

1.8 GHz Pentium 4

1 GByte RAM or greater

1 GByte hard disk space available

Operating System:

Windows Server 2008 R2

32- or 64-bit

Windows Server 2012

64-bit

Windows 7 Professional

32- or 64-bit

Windows 8 Professional

32- or 64-bit

1.2 Product Options and Security

Intellitune uses the Electronic Licensing System and:

All upgrades can be performed electronically;

Supply of all additional options, such as PDF and license Renewal, can be performed electronically;

Supply of trial options and upgrades can be set to expire after a certain time period or date, if required.

1.3 Product Options

Product options include:

Intellitune Site License

This contains the functionality of one server and one client operating on the same platform.

Two IntelliTune platforms will be able to share the same hot folder, and also be able to limit the number of files IntelliTune imports at any time. By setting this number low, we automatically have a type of load balancing.

Annual license

PDF processing product option.

1.4 Dongle Breakdown

Once a dongle has been in use for a few weeks, the software allows a 30-day grace period so that any broken dongle can be replaced without production interruption. System security is preserved so that no one can run two systems by alternating

1.5 The IntelliTune Starter Kit

The IntelliTune Starter Kit includes:

The IntelliTune USB dongle

A CD or DVD containing the IntelliTune installer, documentation, and End User License Agreement

Software is protected by a combination of the hardware dongle attached to the IntelliTuneX System server, and a unique license file that is linked to the installed dongle.

1.6 Disable Indexing Service

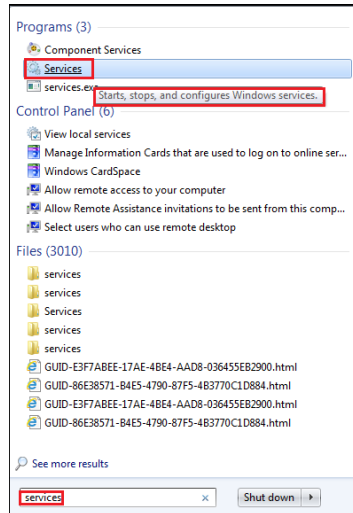

Prior to installation of Intellitune, disable the Indexing Service under Computer Management. If the service is running, it will interfere with the writing of files.

Go to Start

Click on Windows Icon

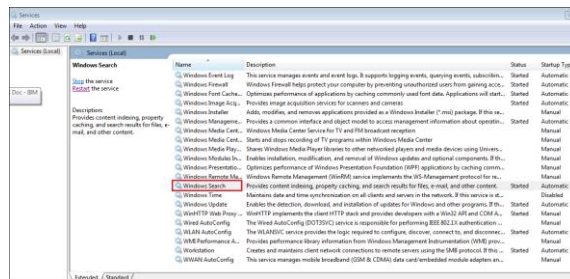

In the search box, type the word **Services**

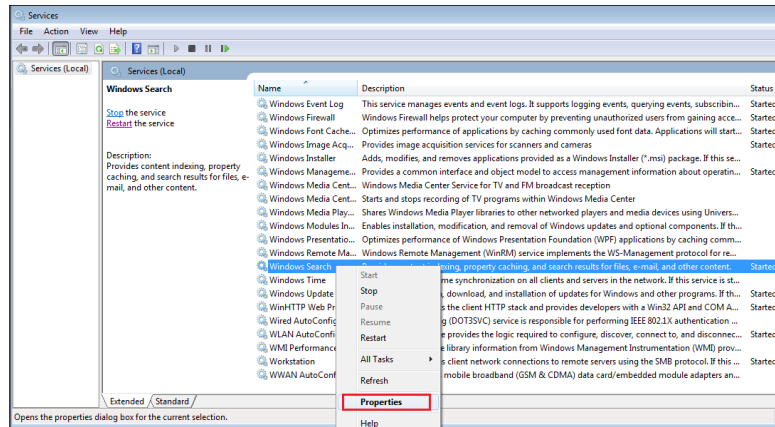

Highlight **Services** then click on it to open Services and Services Applications

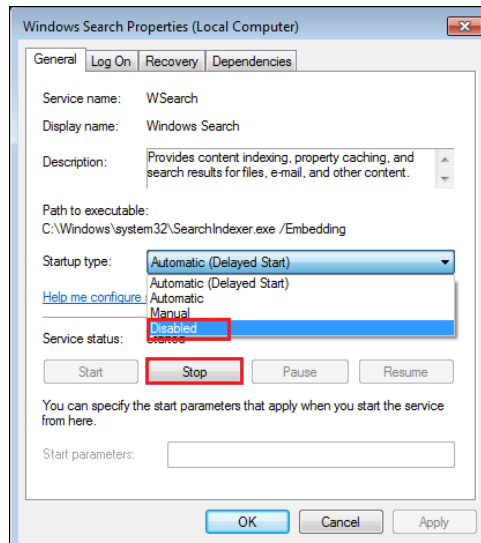

Scroll down and find Windows Search

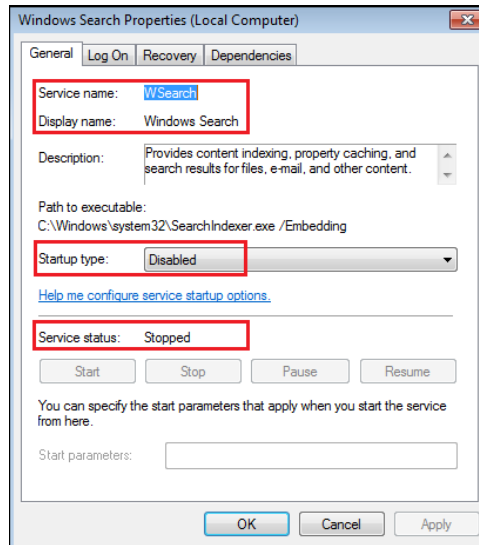

Right click on Windows Search

Right on and Select Properties
 Change Start up type to Disabled
 Change Service status to Stopped
 Click Apply then click Ok

Screen should look like this

Close the Services Dialogue box

2 Pre-Requisites

The following components are necessary for IntelliTune to run. These will be checked and installed during the installation process. They cannot be installed manually.

- ☐ Java Runtime Environment – Java jre1.8.0_51
- ☐ JBOSS updated to Wildfly 8.1
- ☐ Database is now PostgreSQL combined with Hibernate access version 9.3.4
- ☐ ELMS Licensing Service – Version 1.13 – Manages Software Licensing
- ☐ WIBU Dongle and WIBU Security Software – Software driver used to interface with the dongle
- ☐ Visual C++ redistributable package – (vcredist_X86.exe)
- ☐ Updated Visual C++ redistributable package – (vcredist_vc10_X86.exe)

3 Install IntelliTune and Prerequisites on 32 and 64 bit system

Administrator rights are required to install IntelliTune.

CAUTION: Your system must be connected to a network before installing and running IntelliTune, otherwise unpredictable results will occur.

3.1 IntelliTune CD Contains:

Prerequisite software for IntelliTune support. The prerequisites are installed in conjunction with the installer routine, install.hta and DoInstall.vbs support script IntelliTune server and server client IntelliTune remote client (optional, but recommended)

3.2 IntelliTune Prerequisite Software

The Registration Utility – v4701 (setup.exe), this utility is used during the licensing process. The executable software is located in the Registration folder on the CD. During installation, the install dialog may auto-minimize to the task bar where it is accessible for completion of the install routine.

Before You Begin

Check the following:

You received the IntelliTune Starter Kit and attached your IntelliTune dongle.

You have the Receipt Code File (RCF) for your particular installation, and the RCF has been preflighted. Instructions for obtaining the RCF are given in “Checkout Receipt Code”

For systems with multiple network cards, enable only one.

3.3 Launch the IntelliTune DVD/CD

Make sure no programs are running on your system.

NOTE: The application will not work properly without a dongle.

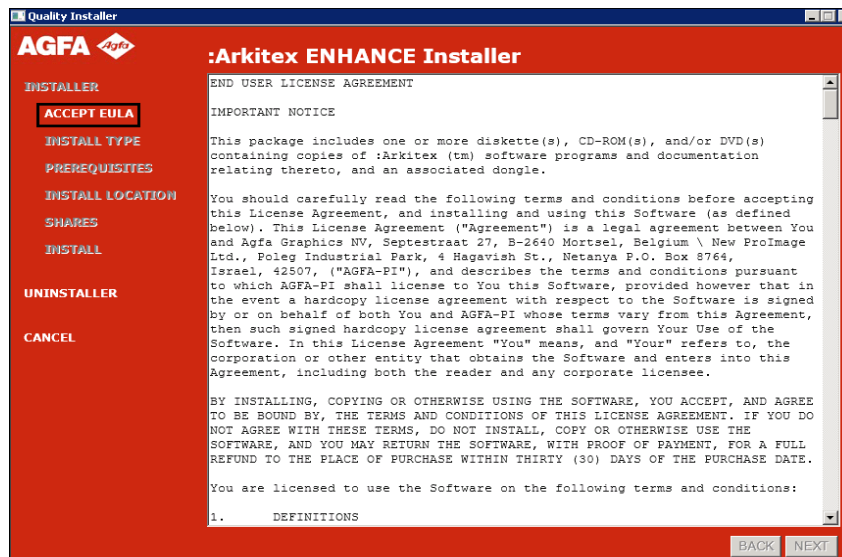

Insert the IntelliTune DVD/CD into the drive.

Click on Intellitune

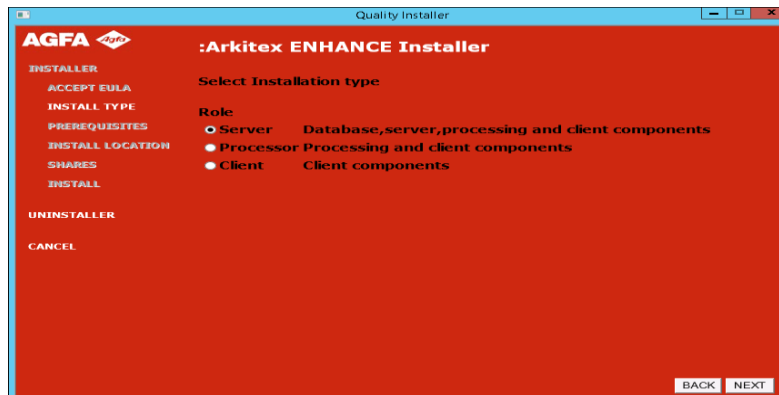

Click on

Accept Eula

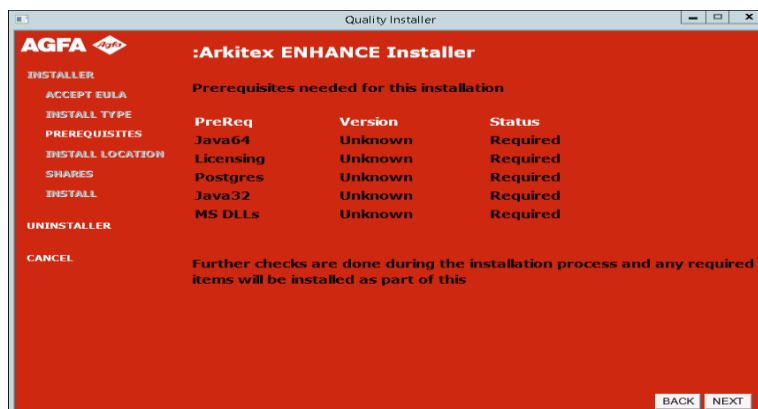

At Install Type screen will display
Select Role: Server, Processor or client
For this install it is Server

Click Next to install the Prerequisites

For each status that is Required, that Prerequisite will be installed

Click Next

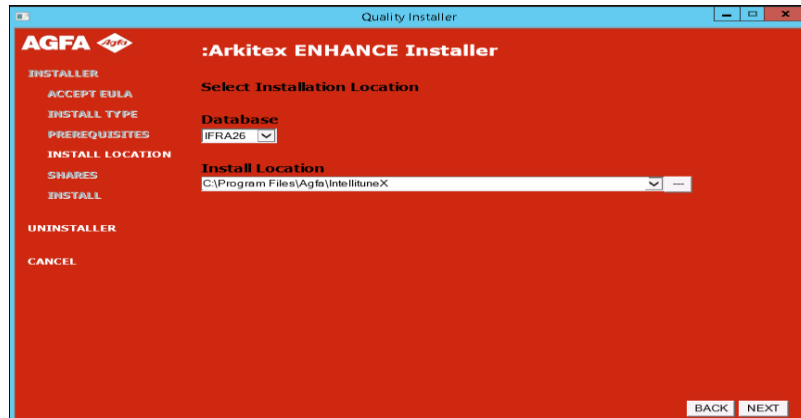

From the Database pull down, the Database can be selected.

There are three databases to select from

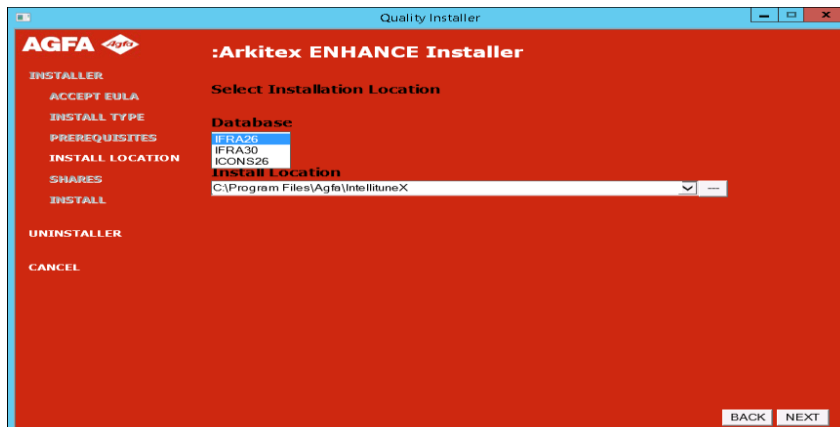

IFRA30 USA

IFRA26 is European

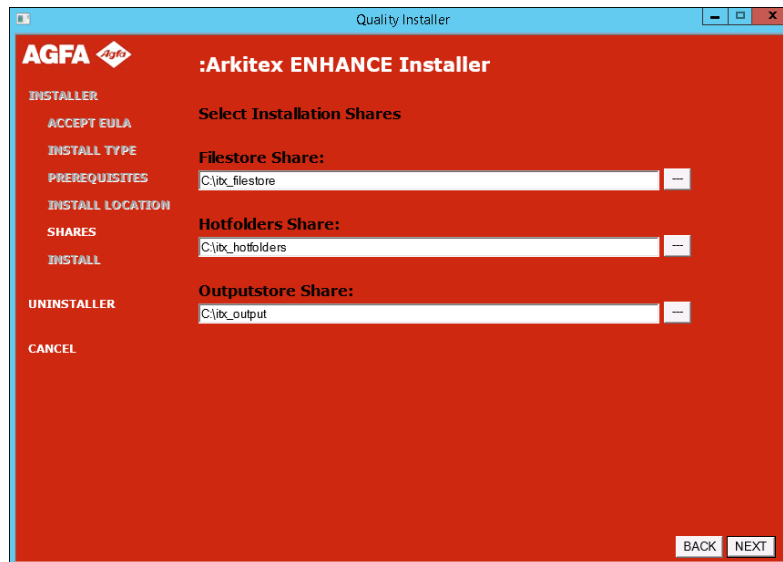

ICONS26 India-Far East

When the database down arrow is clicked on three databases can be selected
The Install Location is also specified on this screen
The Install Location can be changed
Click Next

Click Next
Select Installation Shares
The location of the shares can be changed

Click Next

This screen will allow the user to check setup and click NEXT to install

Changes can be made at this point by clicking BACK

Click NEXT

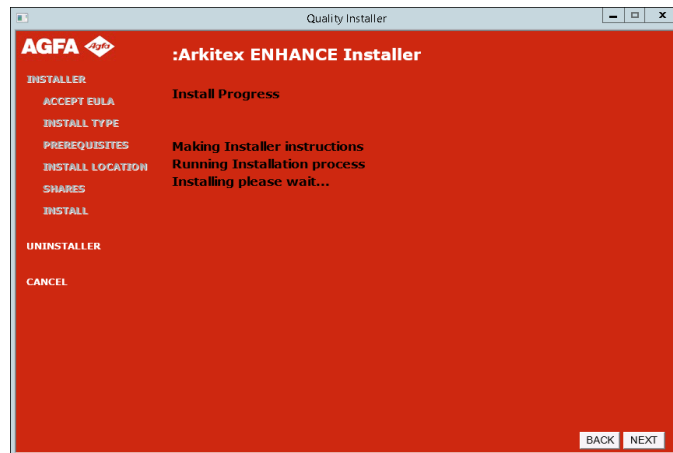

3.4 Pre-Requisites Installation

The following components are necessary for IntelliTune to run. These will be checked and installed during the installation procedures. Do Not manually install.

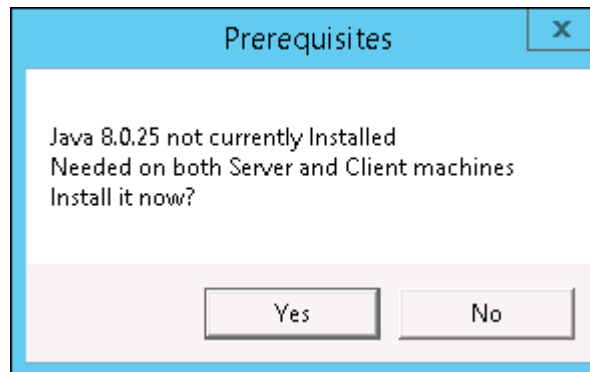

1. Java Runtime Environment updated to Java jre 1.8.0_51
2. JBOSS updated to Wildfly 8.1
3. PostgreSQL Database 9.3.4
4. The Database is now PostgreSQL combined with Hibernate access version 9.3.4, this is a new extra prerequisite.
5. ELMS updated to Version 1.13 – Manages Software Licensing
6. WIBU Dongle and WIBU Security Software
7. Updated Visual C++ redistributable package – (vc redistrib_X86.exe)
8. Updated Visual C++ redistributable package – (vc redistrib_vc10_X86.exe)

Prerequisites will begin to install

3.5 JAVA – 64 bit

1. Answer yes to install Java 64 bit 8.0.25

The Java Setup – Welcome window will pop up
To change destination folder click on the box
Click on Install

Java Setup – Progress screen will display

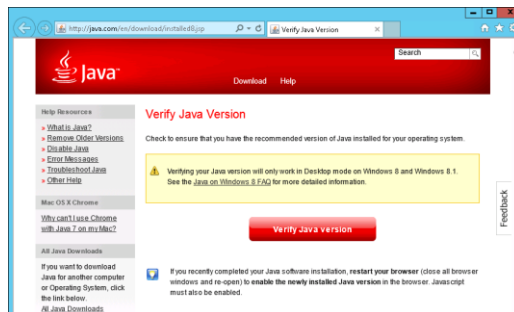

Java Setup – Progress screen after approximately three minutes

Java Setup – Complete screen will display

Click on close

The verify Java version window will display, do not use this close the window

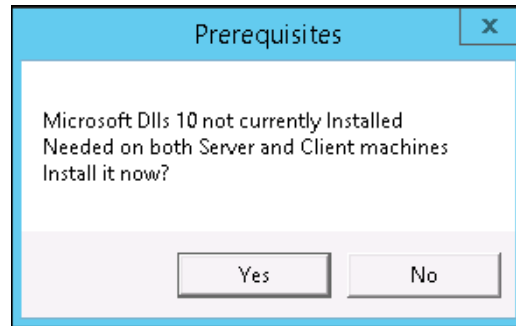

3.6 vcredist_x86.exe

This software installs Microsoft Visual C++ Redistributable.

1. Install Microsoft Dlls 10

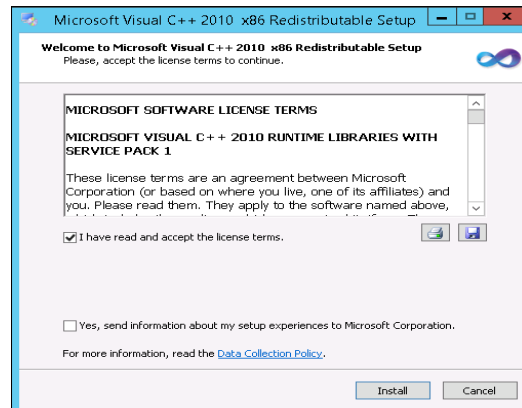

Click on yes to install it now

Welcome to Microsoft Visual C++ 2010 x86 Redistributable Setup

Click on I have read and accept the license terms

Click on Install

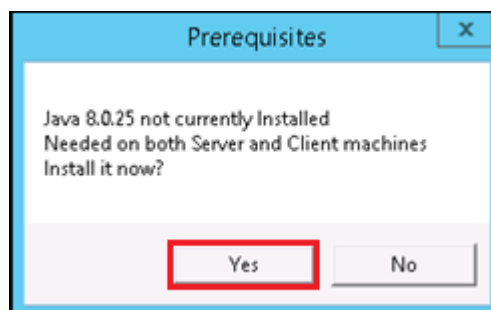

Installation is complete

Click on Finish

3.7 JAVA – 32 bit

1. Install Java 32 bit

Answer yes to install Java 32 bit 8.0.25

The Java Setup – Welcome window will pop up
To change destination folder click on the box
Click on Install

Java Setup – Progress screen will display

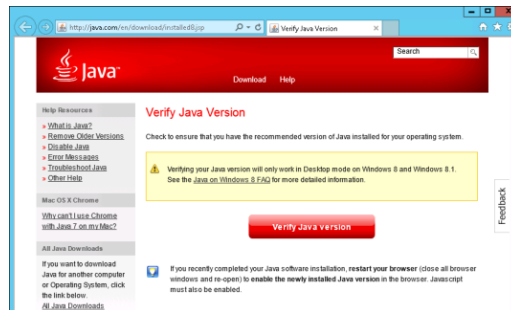

Java Setup – Progress screen after approximately three minutes

Java Setup – Complete screen will display
Click on Close

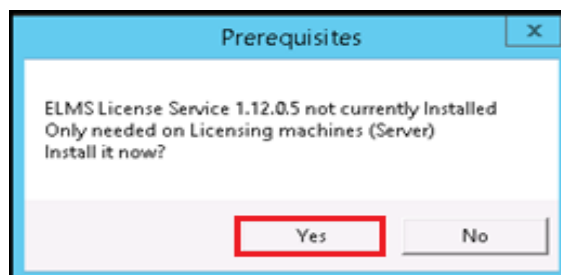

The verify Java version window will display, do not use this close the window

3.8 Install the License Management Utility

1. Install ELMS License 1.12.0.5
Click on Yes to Install

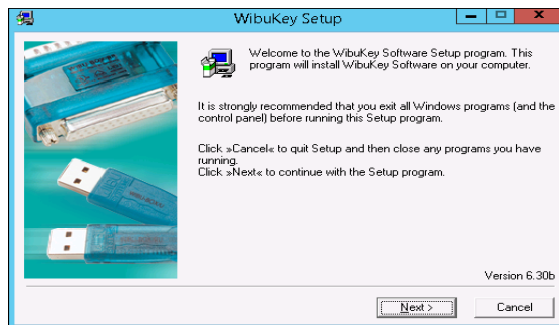

3.9 Install the WibuKey

1. WibuKey runtime kit installing

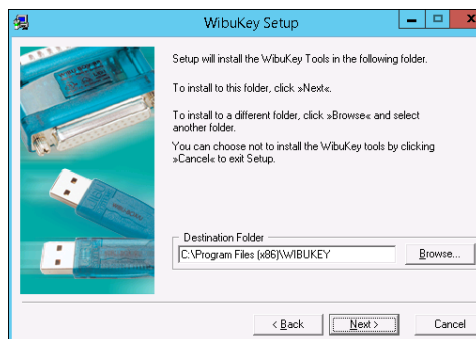

Click Next

Click Next

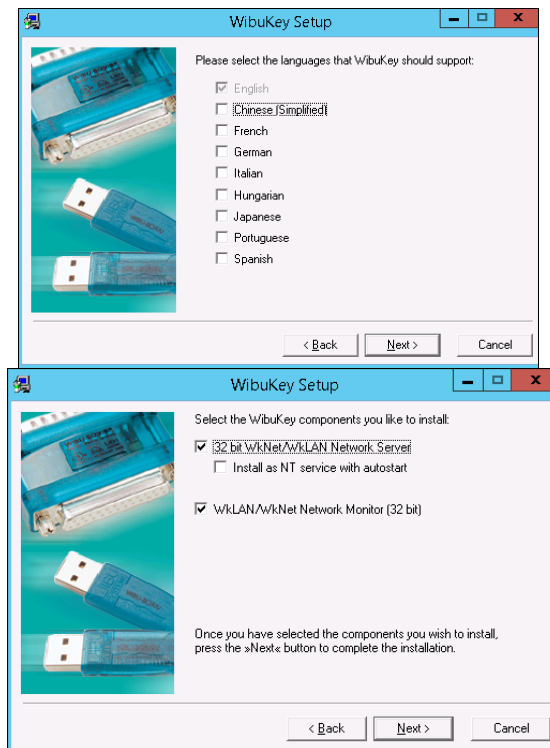

Click Next to use the default folder

Click Yes to create the folder

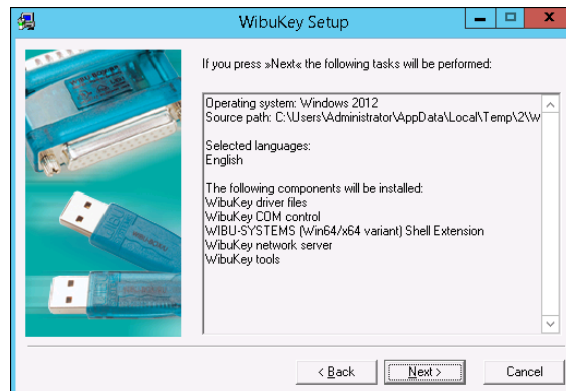

WibuKey setup

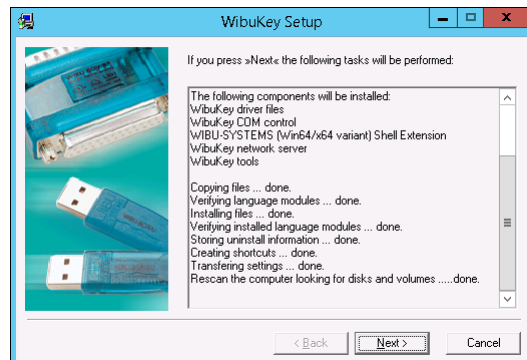

Click Next to continue Setup

Installation will begin copying files

Wibukey installation is complete

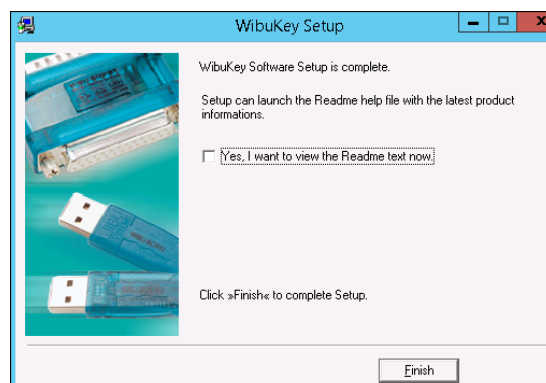

Click Next

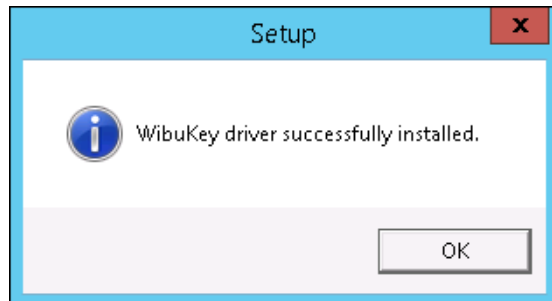

Uncheck Yes, I want to view the Readme text now

Leave checked if you would like to read the readme text

Click finish

Click Ok

3.10 Install the License Management Utility

1. Click Next to continue
Click Next

Choose Destination Location

Click Next

Service Port

Click Next

Start copying files

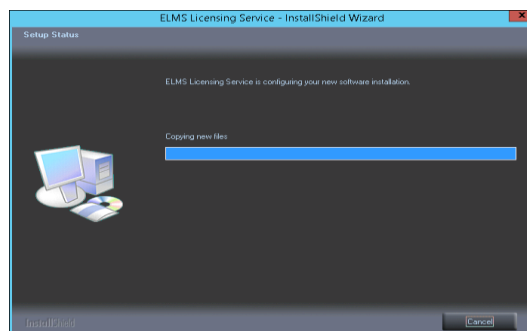

Installing please wait

Installation status

ELMS Licensing Service is configuring your new software installation

This install will take approximately 5 minutes

ELMS Licensing Service installation is complete

Click Finish

3.11 PostgreSQL

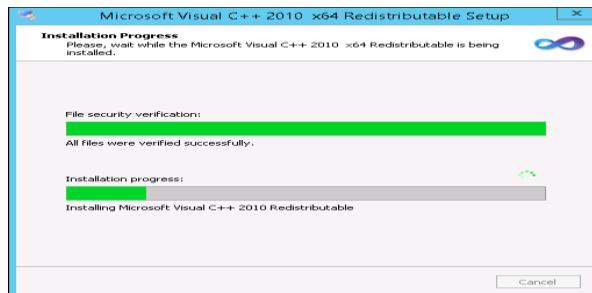

PostgreSQL Database

1. Install PostgreSQL Database 9.3.4 on Serer only
2. Click yes to install

3.12 Microsoft Visual C++ 2010 x64 Redistributable

1. Extracting files will display
2. Installation will began

PostgreSQL Installing

Immediately following the installation of PostgreSQL Intellitune installation will begin

Progress Meter is displayed

Progress Meter is displayed until it is 100%

Intellitune shortcut can be found on the desktop

3.13 Installing Remote Client

The Client is considered remote if it is installed on a different host computer than the server's host computer.

Launch the IntelliTune DVD/CD

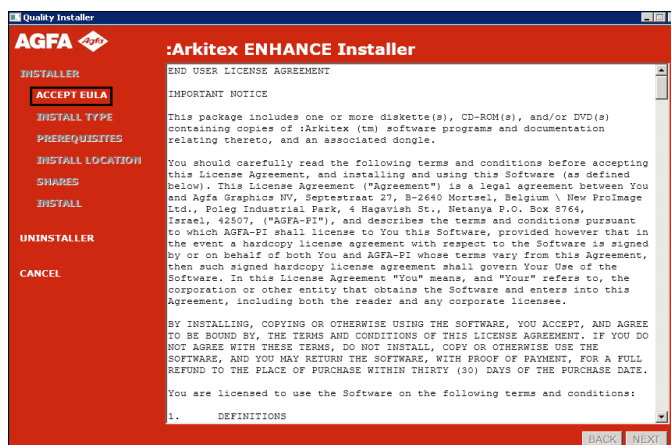

Make sure no programs are running on your system.

NOTE: The application will not work properly without a dongle.

1. Insert the IntelliTune DVD/CD into the drive.
2. Click on IntelliTune

Click on Accept Eula

Click Next to install the Prerequisites

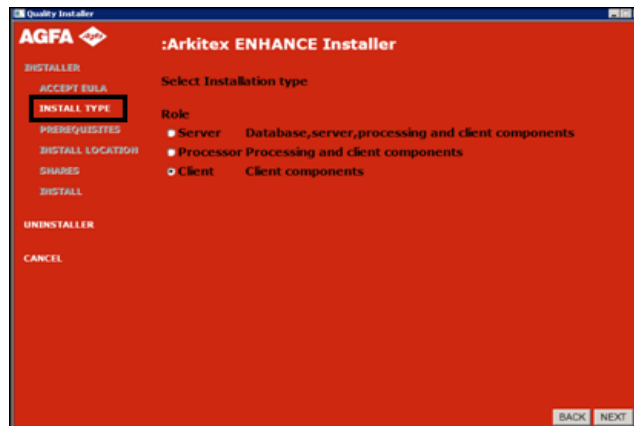

For each status that is Required, that Prerequisite will be installed

Click Next

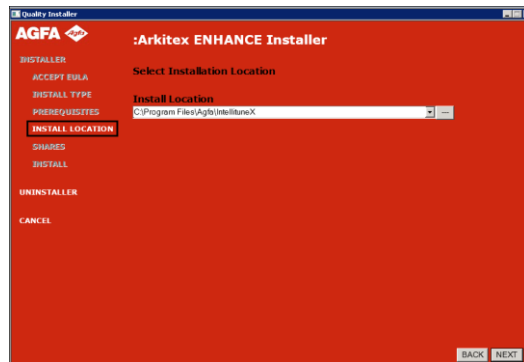

At Install Type screen will display

Select Role: **Server, Processor or client**

For this install Client is selected

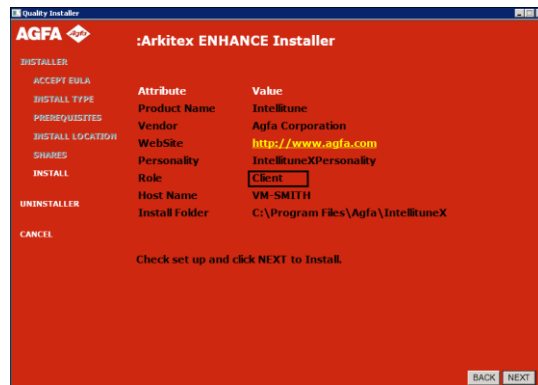

Click Next to accept the installation file location, or click Browse to select another location

The Client Summary screen will display

Click Install or next. The software will begin to install

3.14 Prerequisites

1. Install Java 8.0.51 required on Server and Client

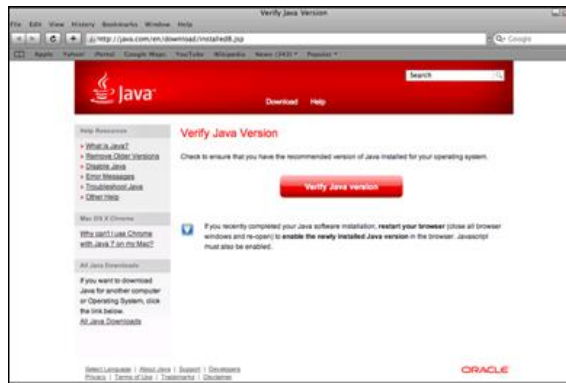

Click Yes to continue installing Java

Click on Install at the Welcome to Java

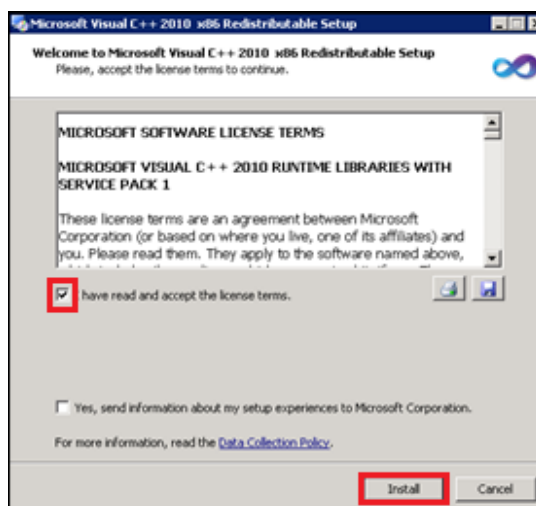

Click to close to exit Java installed successfully window

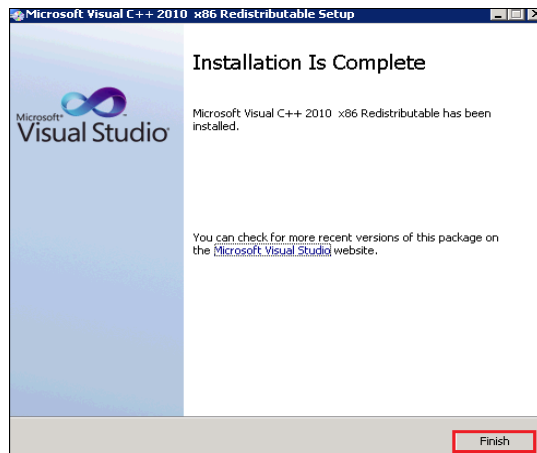

Close browser to exit Verify Java Version, click the 'x' in the upper right corner

Click on Yes to install Microsoft Dlls 10

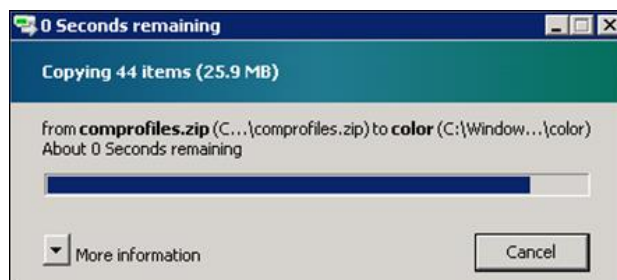

Click in box, I have read and accept the license terms
Click on Install

Click Finish to complete Microsoft DLLs 10 installation

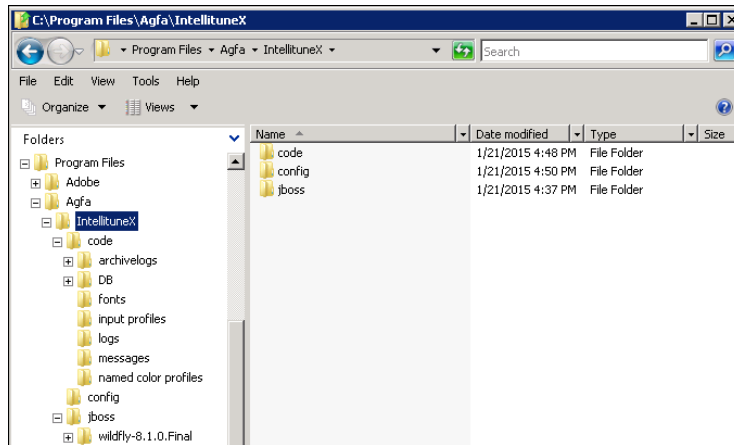

Installer will start installing Intellitune Client

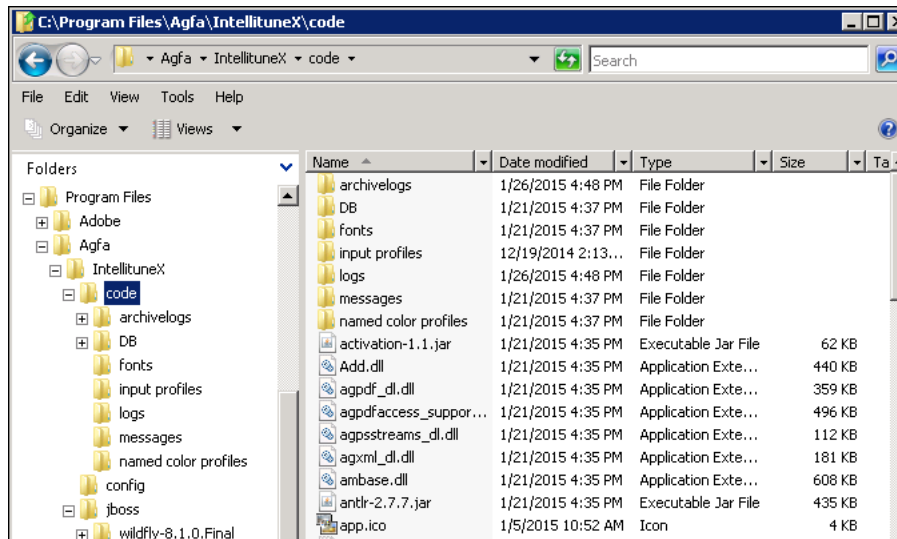

Profiles will begin to install, window will close when installation is complete.

4 IntelliTune File Structure

1. The IntelliTune file structure consists of a code, config and JBoss folders.

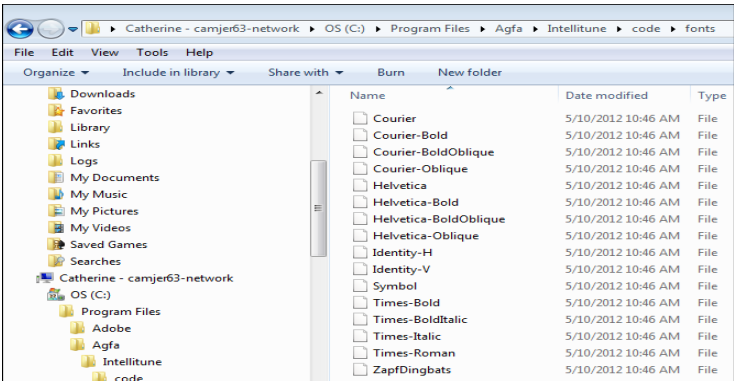

Code Folder

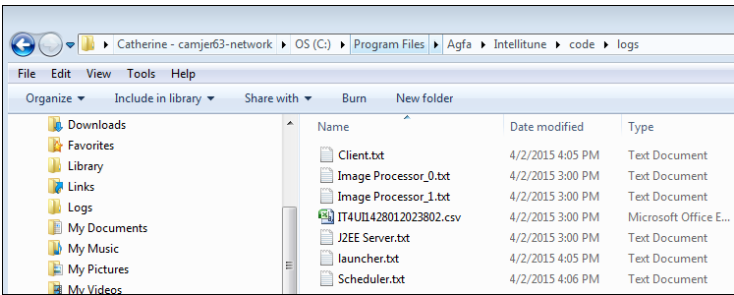

Code Folder sub folders

Fonts

Input profiles

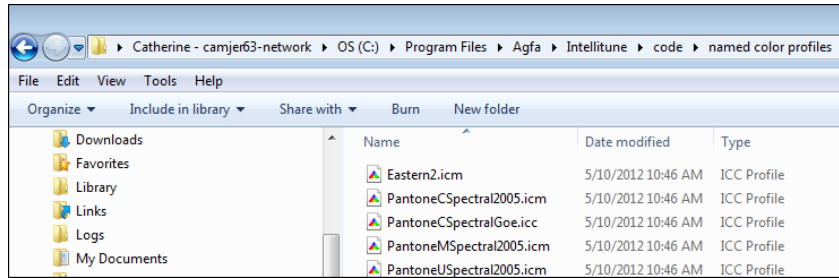

Logs

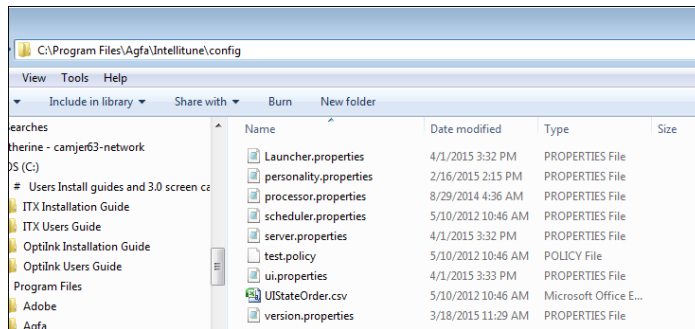

Messages

Named color profiles

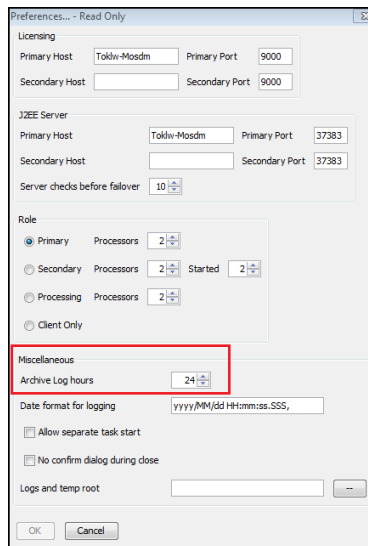

Config Folder Contain the properties files

Archive Logs

Archive logs is located in the miscellaneous section of Launcher Preferences

The default is 24 hours, can be set as low as 1 hour. Must be set before launching Intellitune.

DB <Databases>

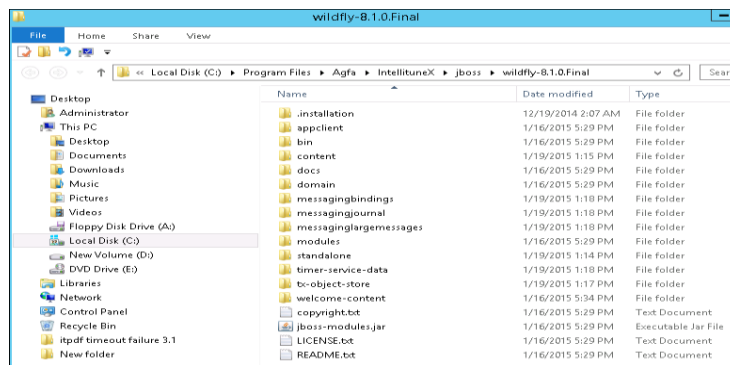

Preconfigured databases are stored here C:\Program Files\Agfa\IntelliTune\code\DB

JBoss Folder

JBoss\Wildfly-8.1.0.Final

5 Launching IntelliTune

1. After installation an IntelliTune icon will appear on the desktop.
2. Launch IntelliTune
3. Click the IntelliTune icon.

The launcher window will display

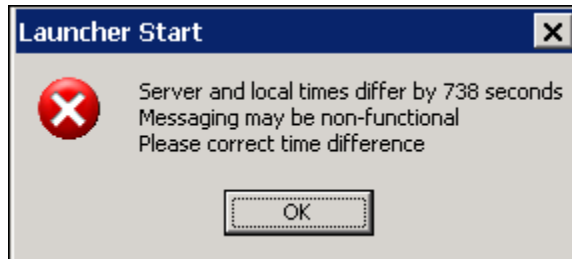

NOTE: If only the Client has been installed, the launcher window will only show the Client service.

5.1 The LauncherUtils.vbs

1. The LauncherStart.vbs script which was used to perform a time difference check at start up has been replaced by the LauncherUtils.vbs script which now takes commands and gets all the server names. It is used to perform the time difference check at start up and then gets called every 6 minutes. Currently this is used to perform a check of the licensing logs folder and removes logs older than 10 days. Note the permissions of the licensing folder are not set to allow delete by default.
2. The location of the Licensing log folder for Windows 7, Windows 2008 and Windows 2012 is located in C:\ProgramData\Agfa Graphics folder\20140925_095435_LicenseServiceLog.xml
3. The file location for LauncherUtils.vbs script is located in C:\Program Files\Agfa\Intellitune\code **LauncherUtils.vbs**
4. First line of LauncherUtils.vbs is: Const TIMEDIFF_WARNING = 480 ' Warn if time difference is more than this value (seconds)

5. LauncherUtils.vbs - If the remote client's local PC system clock is out of sync with server's local time or NTP (Network Time Protocol), a pop up message is displayed to correct time difference.

6 Generating a Fingerprint File

1. A Fingerprint file must be generated. This is an encrypted file that contains the dongle serial number and the unique hardware identification reference.

NOTE: The remote client cannot be used to generate the FPF. Generate the FPF by using the local client (the client installed on the server).

Before starting this procedure, create a folder to store all your license-related files. We advise you to create a folder called Licensing info in the following location:

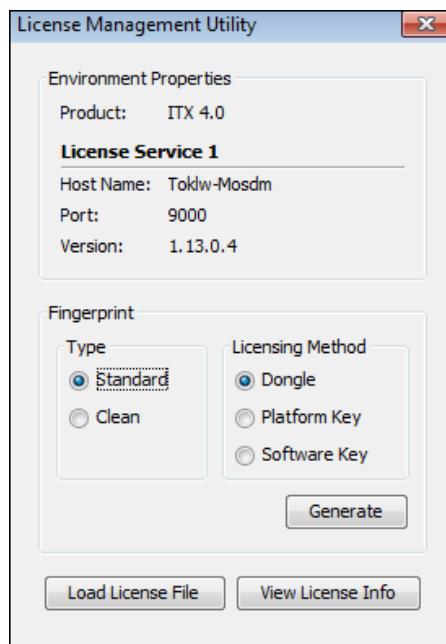

\\Agfa\IntelliTune\SupportFiles\

The following files should be stored in this folder:

- „ Fingerprint File (extension *.fpf)
- „ Receipt Code File (extension *.rcf)
- „ License File (extension *.alf)

The License Management Utility is used to generate clean fingerprint files, load the Arkitex IntelliTune license, and view license information.

CAUTION: These procedures will be performed by the Agfa Customer Engineer at the customer's site.

Product Identifies the product that is being licensed.

License Service Host Name Name of the host where the licensing service is installed.

License Service Port Port number of the host of the licensing service is installed.

Type Identifies the Fingerprint type that will be used for licensing this product.

Standard: Includes a reference of all ELMS product(s) installed on this system in the fingerprint.

Clean: Only includes the product listed under Product above in the fingerprint.

Licensing Method Dongle, Platform Key, Software Key

The screenshot shows the 'License Management Utility' window. It has a title bar with a close button. The window is divided into two main sections. The top section, 'Environment Properties', contains fields for 'Product' (ITX 4.0), 'License Service 1', 'Host Name' (Toklw-Mosdm), 'Port' (9000), and 'Version' (1.13.0.4). The bottom section, 'Fingerprint', contains two groups of radio buttons: 'Type' with 'Standard' (selected) and 'Clean', and 'Licensing Method' with 'Dongle' (selected), 'Platform Key', and 'Software Key'. Below these sections are three buttons: 'Generate', 'Load License File', and 'View License Info'.

6.1 Software Key ELMS protection

The ELMS LicenseService supported **two methods of protection, Dongle protection and PlatformKey protection**. The **Dongle** protection mechanism makes use of a piece of hardware attached to the USB port of the host and the **PlatformKey** mechanism makes use of a 'unique' hash key generated from various attributes of the host. The **Dongle** provides a simple method for physical platforms but is more difficult to use in a VM environment. It would normally require the use of a USB hosting box on the network and these can be susceptible to any network glitches. **PlatformKey** works well without a dongle in a VM environment but the protection mechanism has to employ

characteristics from the hosting environment to prevent abuse. This means that if the VM is moved from one host to another the Licence will go into Grace and relicensing will ultimately be required.

In order to better support VM operation in a full manner where portability between hosts is required we have introduced a third option in the ELMS Licensing mechanism called **SoftwareKey**. This can be used on both physical platforms and VMs and does not rely on use of characteristics from the hosting platform so will continue operation unchanged if a VM is relocated. Instead it uses a reporting mechanism to ensure that correct licensing is being used and no duplicates are being used. This requires that the platform has access to the Internet via an out-g oing https connection. No inbound listening ports are needed so there are no extra threats being introduced. The traffic is very light and the continued product operation is not threatened by any failures in the connection. Sustained failure to communicate will result in dropping into Grace just like a dongle failure and ultimately requiring relicensing.

It is the user's responsibility with SoftwareKey protection to avoid running multiple copies of the same VM platform licence. The reporting mechanism will detect this and will ultimately result in all affected systems being placed in Grace.

NOTE: Platform Key is supported for software trials only.

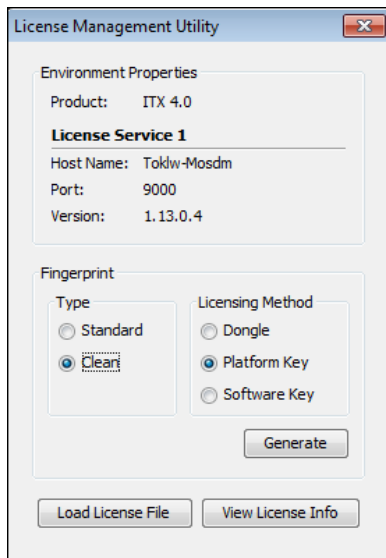

NOTE: When converting from a platform key to a dongle system, just generate a clean fingerprint file. The software will not need to be reinstalled.

6.2 To generate a Fingerprint File

1. **Launch** the IntelliTune application.

From the Menu bar select Licensing > License Management

Select **Clean**

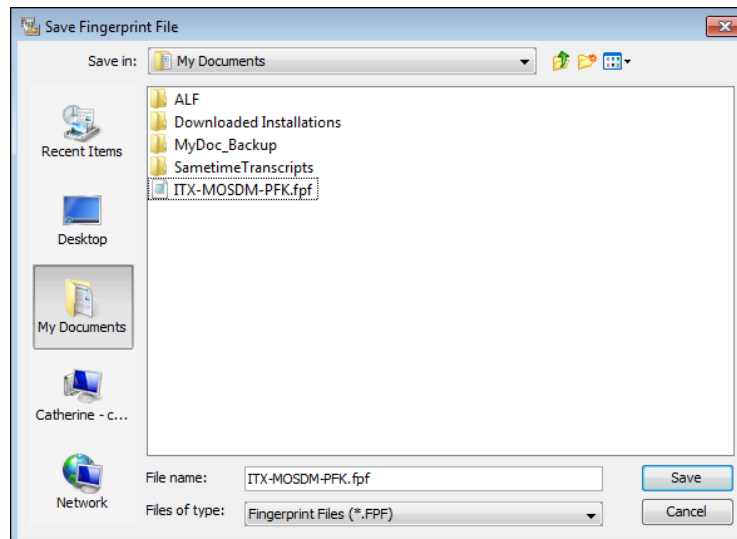

Select **Platform Key**

NOTE: This is only valid for Arkitek IntelliTune trials. Select Clean and Dongle for systems with dongles.

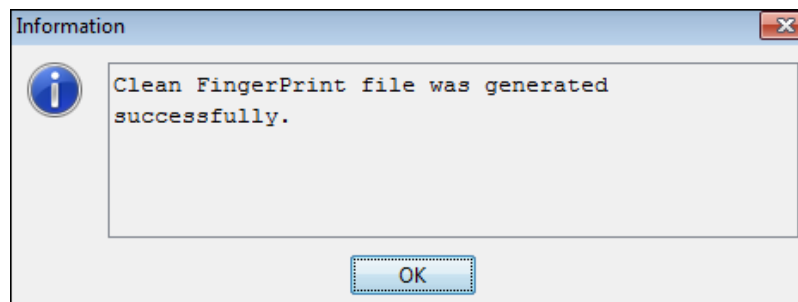

Click Generate

A warning message will display. Click **Yes**

When prompted enter a file name (e.g., Customer name or Server name) and an extension of fpf (i.e., FT.fpf) to generate the Finger Print File. Click **Save**

At the Fingerprint generated successfully message, click OK.

Click the "X" in the upper right-hand corner to close the License Management Utility.

6.3 Load License File

The following procedure describes how to load the license file.

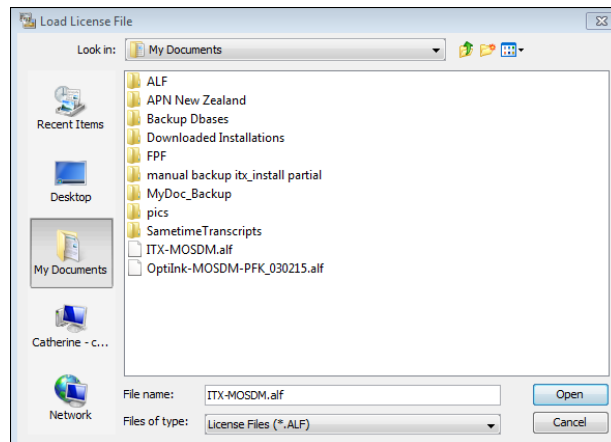

1. Click Licensing > Management

Select Load License File

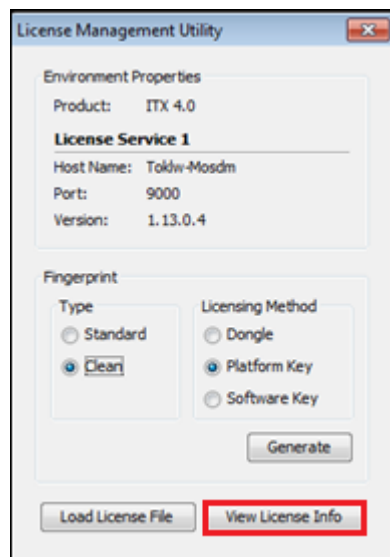

Locate the license file. It will have an *.alf extension.

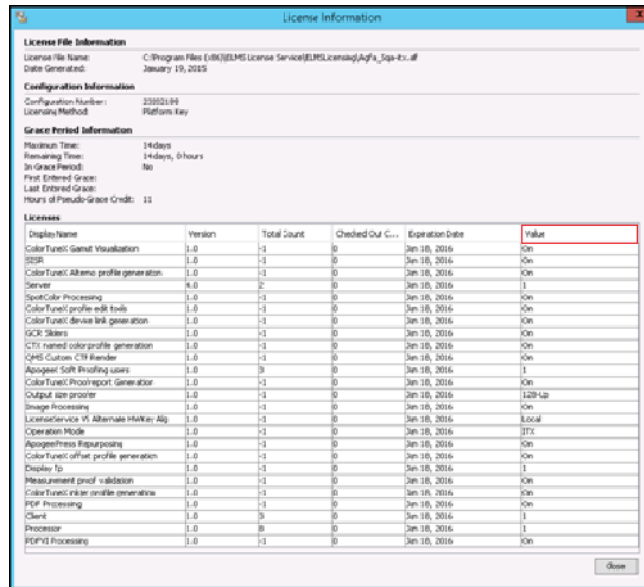

Click Open

A confirm message will appear. Click Ok

To verify the license, refer to “View License Info”

License Information

License File Name: C:\Program Files (x86)\ELMS License Service\ELMSLicense\Arlis_Sys-11.0
 Date Generated: January 19, 2015

PDF Processing	1.0	13	0	Jan 18, 2016	0m
Client	1.0	3	0	Jan 18, 2016	1
Processor	1.0	3	0	Jan 18, 2016	1
PDF4 Processing	1.0	13	0	Jan 18, 2016	0m

There is a new column called “Value” from 4.1 and above

1. Click the “X” in the upper right-hand corner to close the License Management Utility
- Start Tasks
- The following procedure describes how to Start Tasks.
- Select Tasks > Start All.

Services will start to load. You will see messages appear on the screen

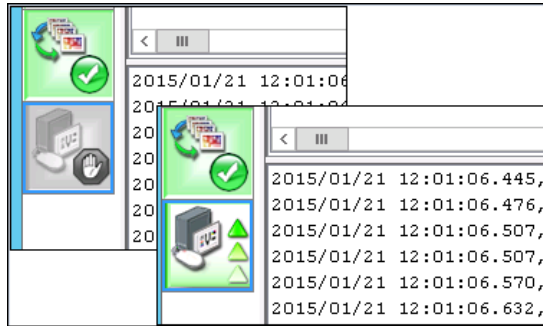

6.4 Start the Client

The following procedure describes how to start the client.

1. Select Tasks > Start Client.

The Client service will turn green when it starts

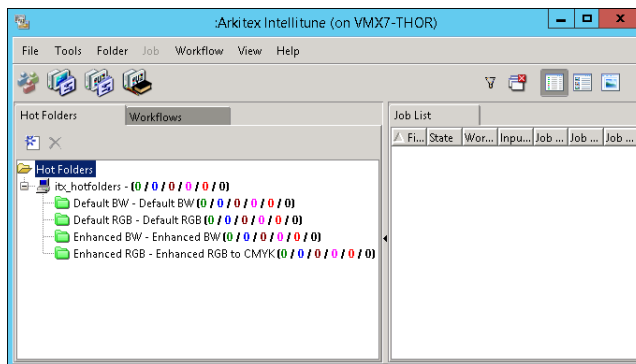

The login menu will display

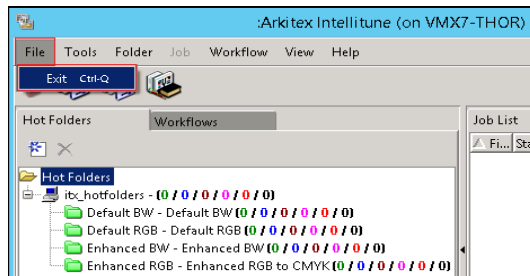

Enter the password: **Administrator**. Click **Login**

The IntelliTune Client will display

6.5 Closing the IntelliTune Client

1. Select File > **Exit** from the menu bar on the Client

The IntelliTune Launcher window will display. The Client service component will be grayed out.

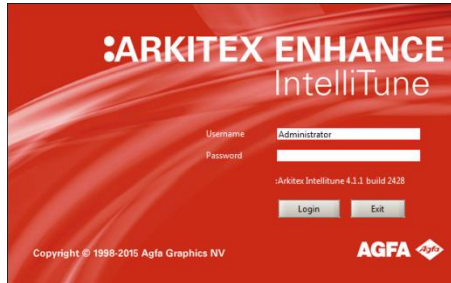

6.6 Restart the Client

1. Once the Client has been stopped, you can restart and login again.
2. To restart the Client, select Tasks > Start Client.
3. You can also use a shortcut menu to start and stop the client
4. Left-click to select the Client icon, then right-click. A shortcut menu will display.

Select Start the Login screen will display, and you can login

7 The IntelliTune Launcher

From the Intellitune Launcher you can do the following tasks:

Set Preferences

1. Start Tasks
2. Perform Database Maintenance
3. Load Licenses, Generate Fingerprint files and View License Info
4. Install and remove ICC profiles in support of SISR (Smart Input Space Recognition)
5. Help > About - Check the Version Level of IntelliTune

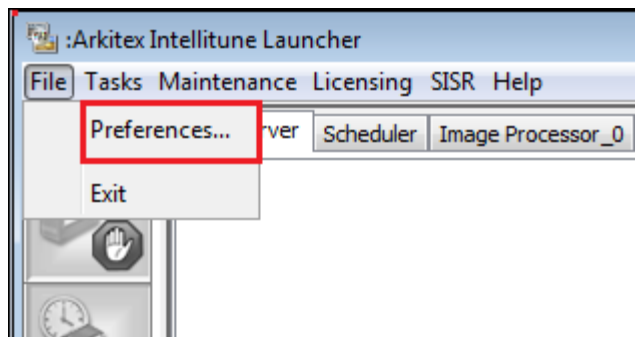

7.1 Set Preferences

Preferences controls licensing, the licensing host, and the client host. This is a detailed explanation of when each item is on the Preferences User Interface

NOTE: The Launcher Preferences dialog can be shown at any time, but is Read Only if any component is running, and the OK button is grayed out to disable any editing.

Set Host

1. Select **File > Preferences** from the Launcher menu bar.

The Preferences dialog box will display

Preferences supports **primary** and **secondary** licensing, and J2EE server set ups, as well as selecting the Role and number of Processors.

The key to understanding the first part of Launcher preferences is that a platform may be set up in one of 4 Roles controlled by the radio buttons. Also the configuration is designed to allow maximum flexibility and the freedom to use as many platforms as desired.

Working from the bottom upwards starting with Role
Under Server checks before failover, click on client only

Client

Client only is a platform that will only be used as a client. It has no scheduled processing capability, hence no processors, but does need to know the J2EE server locations in order to know who to talk to and these won't be localhost. Although it doesn't need the Licensing services for operation, it does need them to check on the Licensing state and allow the Licensing management display to operate.

The screenshot shows a 'Role' configuration window with four radio button options: Primary, Secondary, Processing, and Client Only. The 'Client Only' option is selected and highlighted with a red rectangle. Each option has a 'Processors' field with a spinner set to 2. The 'Secondary' option also has a 'Started' field with a spinner set to 2.

Processing Processing is a role for a platform that is dedicated to running pure processing as extra capability to those available on the server platforms. It therefore has a set up for the **number of processors**. A client is actually available but is typically not used. Just like the client it needs to know the address of the server(s) so that it can communicate with them. These addresses would certainly not be localhost as the server is on a different platform. To illustrate its use I could set up a 2 server system with say 2 processors each and then two other pure processing platforms with 4 processors each to give me 12 processors in total (assuming I have the relevant number of licenses). Another potential usage is in a fail-over scenario where when the primary fails the number of processors available may decrease. By having another processing only platform they can take over the spare processor licenses that then become available. This all happens automatically. When a processor starts it talks to the server and the server will give it a license if one is available. If not then the processor is still alive and known to the scheduler but will not be given any work (as it is unlicensed). If a license becomes available for some reason then the scheduler will then allocate it to any known dormant processors which can then start work.

The screenshot shows the same 'Role' configuration window. The 'Processing' option is now selected and highlighted with a red rectangle. Its 'Processors' field is also highlighted with a red rectangle and set to 4. The 'Client Only' option is now unselected.

Secondary A Secondary server is a role where there is backup server / database / filestore ready to take over if the primary fails. It can run a number of processors and actually has two configurations for the number of processor which get started. **The first number (on the left) is the processors which will be used when it is in its normal (non-operating) role. The second 'started' number is the number that will be used if it ever takes over the main operation. This allows, for example, maximizing the number of processors during normal operation and lowering it a little during back up so there is some spare capacity for the scheduling work it is now doing.** Note it needs the address of the servers. The Primary server won't be localhost as it is a remote system. The secondary server name will be used by the local processors if it fails over.

The screenshot shows a configuration window titled 'Role'. It contains four radio button options: 'Primary', 'Secondary', 'Processing', and 'Client Only'. The 'Secondary' option is selected and highlighted with a red box. To the right of each radio button is a 'Processors' field with a numeric spinner. For 'Secondary', the 'Processors' field is set to 2 and is also highlighted with a red box. To the right of the 'Processors' field for 'Secondary' is a 'Started' field with a numeric spinner set to 2, also highlighted with a red box.

Primary A Primary server is a role used either as the one and only non-backed up server or as the primary server in a fail-over configuration. It only needs one set of processor numbers as it is started by default and in a fail over situation is non-operational by definition. It needs to know the name of the secondary server in a fail over configuration in order to know where to back up the database and files to.

The screenshot shows the same configuration window titled 'Role'. In this view, the 'Primary' radio button is selected and highlighted with a red box. The 'Processors' field next to it is set to 2 and is also highlighted with a red box. The 'Secondary' option is unselected, and its 'Processors' field is set to 2. The 'Processing' option is unselected, and its 'Processors' field is set to 2. The 'Client Only' option is unselected. Below the role options is a 'Miscellaneous' section.

Note also that the number of processors for the servers can be set from 0-16. 0 means what it says, i.e. you do not need to run any processors on a server machine. Of course you need some somewhere otherwise no work gets done. A processor only machine has a lower limit of 1 as 0 doesn't make any sense for that role. The max number 16 is set to avoid people entering stupid numbers. We can actually change that (MaxPlatformProcessors in Launcher.properties) in case anybody has a mega platform with more than 16 cores.

The checkbox called Allow separate task start is a convenience option. Normally you just do a Start All / Start Client as required. If this option is checked then you can start and stop each individual module by right clicking its icon. This can be useful during debugging or running special tests (e.g. stopping one or more processors) but there are no checks here so it is the user's responsibility to have sensible combinations of modules running. Start All etc is still operational with this option enabled.

The checkbox called No confirm dialog during close does what it says. By default (unchecked) if the user tries to close the system (e.g. click X) then you get a confirm dialog to ensure that you intended to do that. When the box is checked there is no confirm dialog boxes.

Miscellaneous

Start Tasks

1. **Tasks** controls starting/stopping service components, auto start (Tasks) and start client. By default when Launcher is first opened, no tasks are started.

7.2 Launch Service Components

1. Select **Tasks** from the Launcher menu bar.
2. Select **Start All**.
3. The service components will begin to start, and messages will display across the screen.

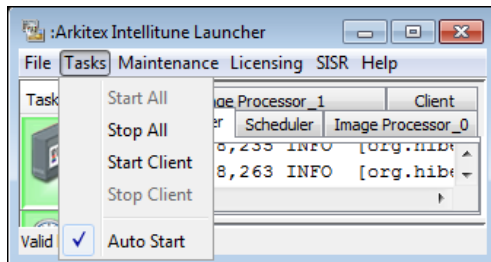

7.3 Activating Auto Start

1. The following procedure describes how to activate Auto Start.

Steps

To automatically start tasks when IntelliTune is launched, select **Tasks**, then select the **Auto Start** option.

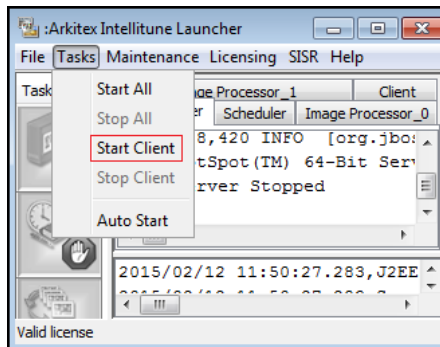

When the Tasks menu is displayed again, this item will display with a check mark. The Launcher must be restarted for this setting to work.

Start Client

1. The following procedure describes how to start the client.

Steps

2. Select Tasks from the Launcher menu bar, and select Start Client.

3. To stop the Client, select **Tasks**, and then select **Stop Client**

Stop All Service Components

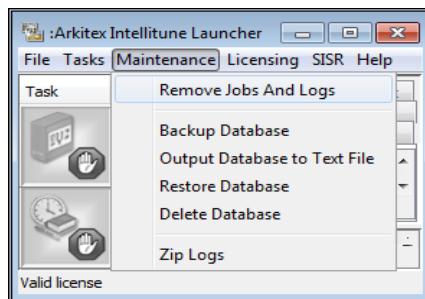

The following procedure describes how to stop all service components.

Steps

1. Select **Tasks** from the Launcher menu bar.
2. Select **Stop All**.
3. The service components will be grayed out as they are stopped.

Performing Database Maintenance

When all the service components have been stopped, clicking Maintenance brings up the following selections.

Remove Jobs And Logs

1. Jobs and Log files will be removed if 'yes' is answered to the prompt. If a check is entered in the box next to Reset Job and Log Numbering, job numbers will be reset to the number one.

2. Click ok to Jobs and Logs Removed

7.4 Backup Database

The database can be backed up to a ZIP file using the **Maintenance > Backup Database** menu in the Launcher while ITX is shutdown. This will preserve all workflow and hot folder settings. To minimize ZIP file size, make a backup when there are not many jobs in the system. This can be performed by selecting Remove Jobs and Logs before backing up the database

Remove Jobs and Logs

1. Click Remove Jobs and Logs
2. Output Database to Text File
3. The workflow and hot folder settings will be output to a text file. The default location is the location of the user's Document's, enter a name for the file.

7.5 Restore Database

The database will be restored from the backup location.

To restore a database (from a previous backup, or an Agfa supplied ZIP), use the **Maintenance > Restore Database** menu in the Launcher while IntelliTune is shutdown.

1. Select the database name to restore
2. Click on Open
3. Click on box to enter a check mark if you want to Reset Job and Log Numbering
4. Answer the prompt "yes or no" to Remove Jobs and Logs
5. If you answered yes to the prompt, a message will display Jobs And Logs Removed
6. A database saved from one PC can be restored onto a different PC.

CAUTION: The Root Folders that a user can create as an input or parent input folder are not restored by the DB restore action. Root Folders must be manually created and manually shared with all Permissions for Everyone set to Allow ON. Proofer folders are not created by a Restore DB maintenance action. The user must manually create Proofer folders and manually share Root folders with all permissions.

7.6 Delete Database

The database will be deleted.

Select **Maintenance > Delete Database**

Answer Yes or No to the question “Are you sure you want to delete the database”?

You will be prompted to backup the database prior to deletion.

If you answer yes to the question a dialogue box will display to enter the filename and save it. If you answer No the window will close

ZIP Logs

All logs can be backed up to a zip file.

1. Select Maintenance > Zip Logs
2. Enter a name in the dialogue box
3. Click Save
4. Logs are saved in default location but can be stored where you choose
5. Screen capture of logs that are zipped.

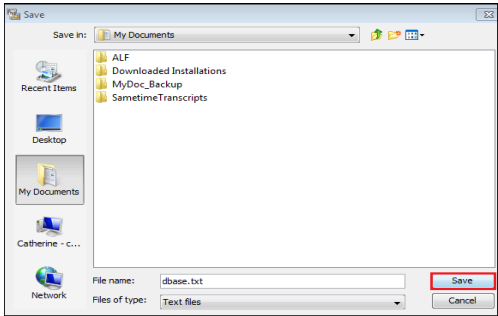

Output Database to Text File

Click Output Database to Text File.

A **Save** dialog box will display.

Choose the folder location in the Save In box and the File name for the backup.

Click **Save**.

Backup Database

Click **Backup Database**.

A **Save** dialog box will display.

Choose the folder location in the Save In box and the File name for the backup.

Click **Save**

Restore Database

Click **Restore Database**.

An **Open** dialog box will display

Choose the folder location in the Look In box and the File name of the database to restore. Click Open.

Delete Database

Select **Delete Database**.

A prompt will display asking if you are sure.

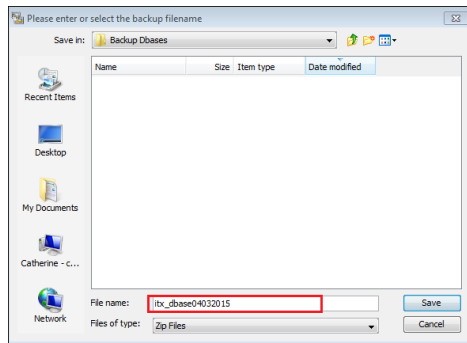

Click **Yes**

A prompt displays asking if you want to backup the current database.

Click Yes

A **Save** dialog box displays

Select the **location** for the backup
Enter **filename** to save

Click on **save**

ZIP Logs

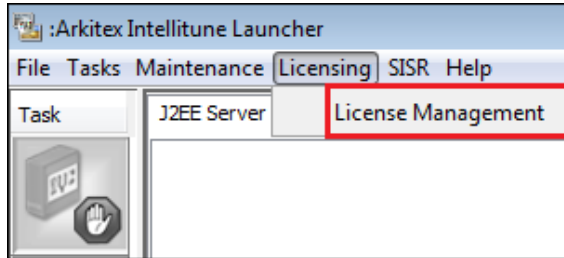

Click ZIP Logs.
A Save dialog box will display.

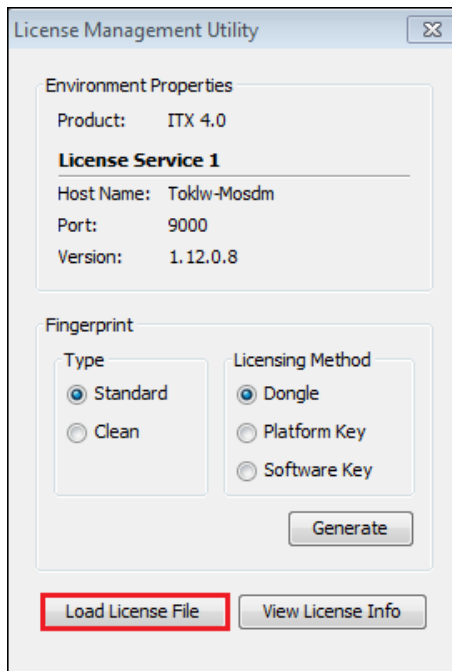

Licensing

Before using Intellitune Load the license file

Load License File

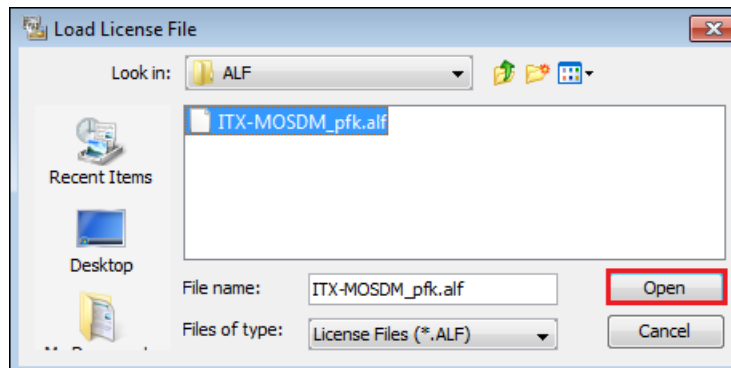

Click **Licensing > License Management**

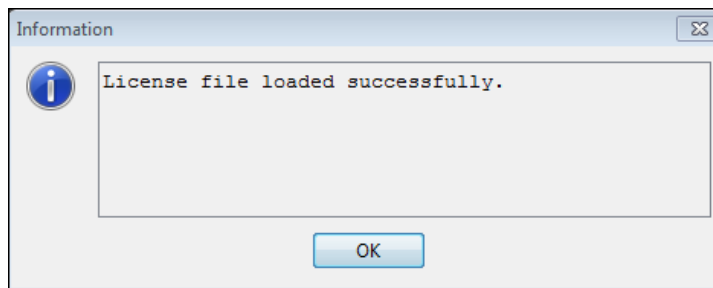

Select Load License File

Locate the license file. It will have an *.alf extension

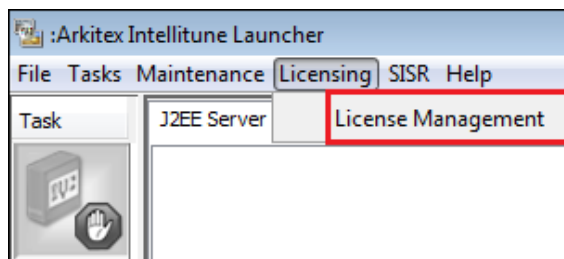

6. Click Open

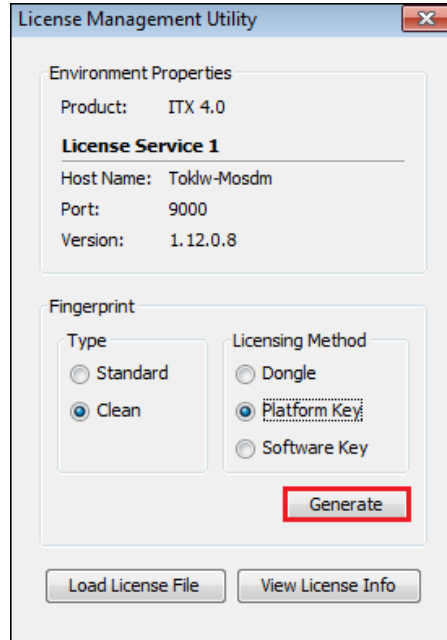

7. A Confirm message will appear. Click Ok
8. Click the "X" in the upper right-hand corner to close the License Manager Utility

Generate Clean Platform Key Fingerprint File

1. **Launch** the IntelliTune application

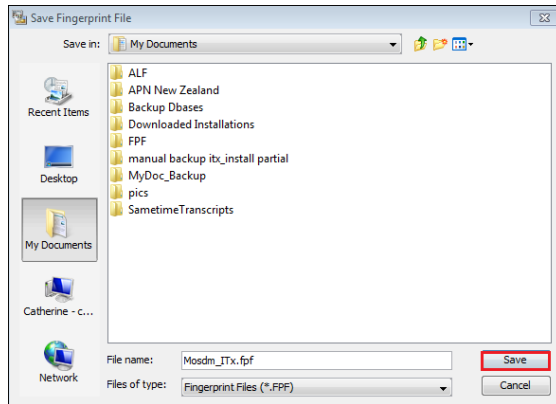

2. From the Menu bar select Licensing > License Management

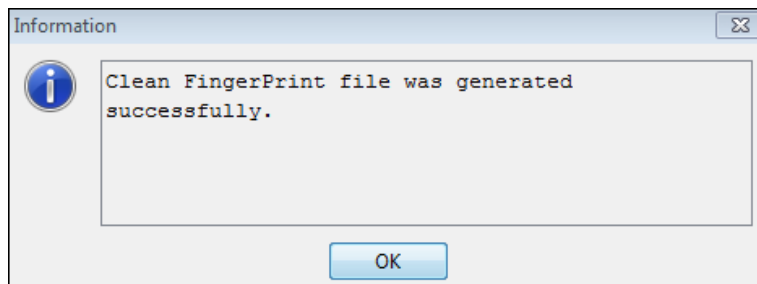

3. Select **Clean**
4. Select **Platform Key**
5. Click **Generate**.
6. Answer Yes to the warning question

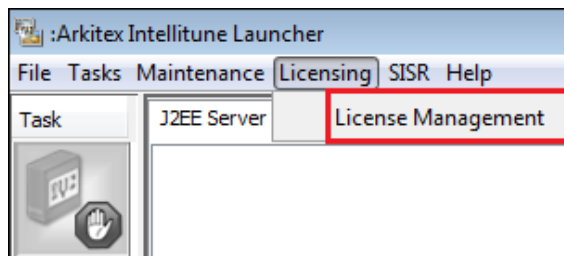

- When prompted enter a file name (e.g., Customer name or Server name) and an extension of fpf (i.e., FT.fpf) to generate the Finger Print File. Click Save.

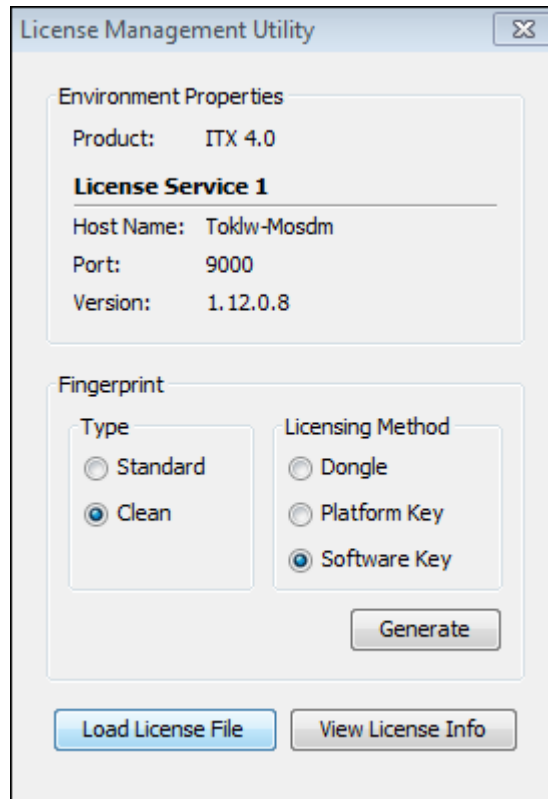

- At the Fingerprint generated successfully message, click OK.
- Click the “X” in the upper right-hand corner to close the License Management Utility.

Generate Clean Software Key Fingerprint File

- Launch** the IntelliTune application

From the Menu bar select **Licensing > License Management**

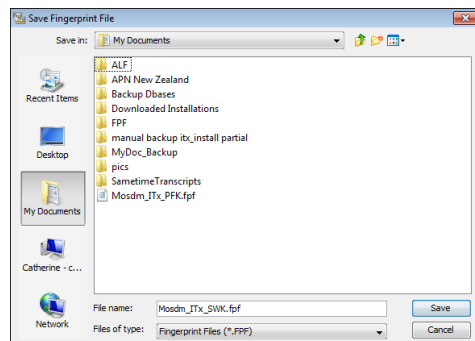

Select **Clean**

Select **Software Key**

Click **Generate**.

Answer **Yes** to the warning question

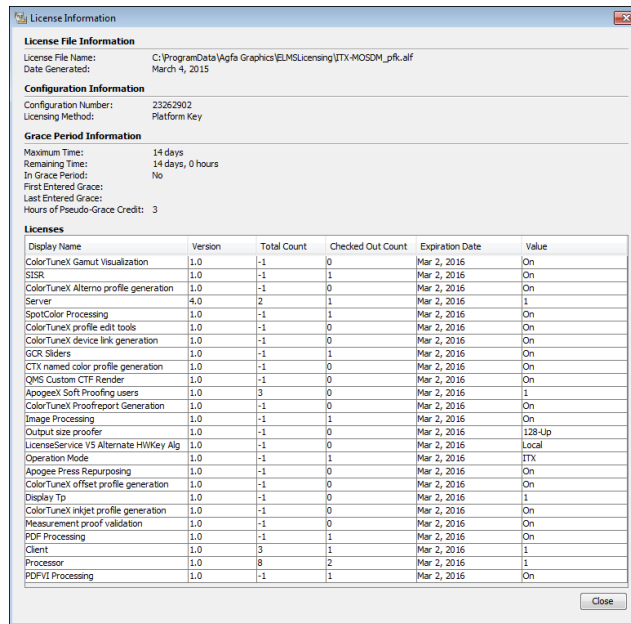

2. When prompted enter a file name (e.g., Customer name or Server name) and an extension of fpf (i.e., FT.fpf) to generate the Finger Print File. Click Save.

3. At the Fingerprint generated successfully message, click OK.
4. Click the "X" in the upper right-hand corner to close the License Management Utility.

Show License Info

1. Select License > License Management
2. To confirm the license information, click View License Info

3. Click Close
4. Click the "X" in the upper right-hand corner to close the License Management Utility.

SISR profiles are installed during the installation.

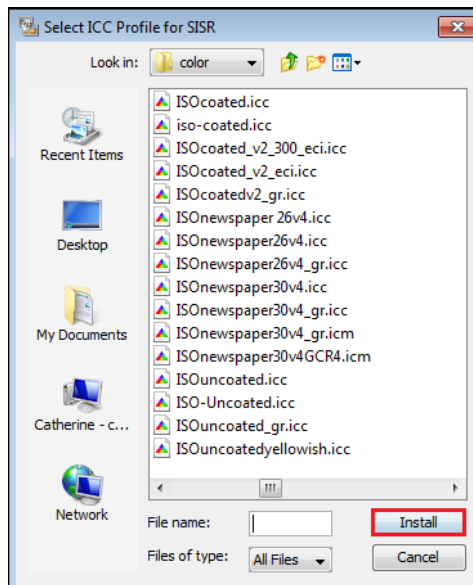

StartInstall script supports a facility for loading profiles from folders under a profiles folder in the install set. This allows the profiles to be customized for different installs without having to include them all in the base set. The profiles folders are specified in the Personality.properties file.

SISR profiles can also be installed using the SISR Install and Remove menu items on the launcher. The relevant menu items will only be visible if a processor is installed. Only profiles that have been installed in the system ICC profile folder should be used.

5. Select Install ICC Profile from the menu.

6. Select the ICC Profile from the list.

NOTE: Multiple selections can be made, and the user will be warned if a profile already exists in the destination folder. Only CMYK profiles should be selected for install.

7. Click Install

NOTE: It is important to manually synchronize all the profiles used on the server and all remote clients. If these are not present on the remote client, then the remote client will not display Job Edit source/result views correctly, or fail to display them at all.

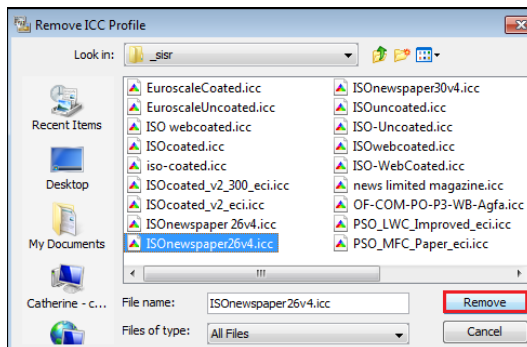

Remove ICC Profile

1. When the Remove ICC Profile menu item is selected, the contents of the processor SISR profile folder will be displayed. Select profiles from the list and remove using the Remove button.
2. Select Remove ICC Profile from the menu.

NOTE: Multiple selections can be made for removal

Select the ICC Profile to be removed.

- 3 Click **Remove**.
- 4 A prompt will appear asking you to confirm the removal of profiles from SISR folder.

Click **Yes** to confirm removing the selected profile.

Click **No** to cancel.

Click **Cancel** to cancel the operation.

Restore Default SISR Profile

When defined in personality.properties a third selection is displayed from the SISR pull down to allow Restore **Default SISR profiles**

Before edit of personality.properties the pull down has two options

After edit of personality.properties “Restore Default SISR profiles” is added to the menu list

Example of personality.properties edit:

C:\Program Files\Agfa\ITX_4.0\config\personality.properties

Add profiles to SisirList = and separate each profile with a comma

SisirList= ISOnewspaper26v4.icc, ISO-WebCoated.icc, ISOcoated.icc,

Help

1. Help displays information about the IntelliTune Launcher and Weblink when configured.

Launcher Help About

2. Click **File > Help** and select **About**.

3. The About dialog box will display.

4. The version and copyright information displays.
5. Click OK to close the dialog box.

Client Help About

Now it is controlled by the WebLink property in the personality.properties file. For example, in IntellituneX personality.properties file there is a line like WebLink=Arkitex Web,http://arkitex.agfa.net

Archive Logs Folder

1. Logs will be archived when the Launcher is started up. These are zipped to an archivlogs folder every time the Launcher is restarted. A clean ArchiveFiles function checks the archivlogs folder and removes logs more than 30 days old

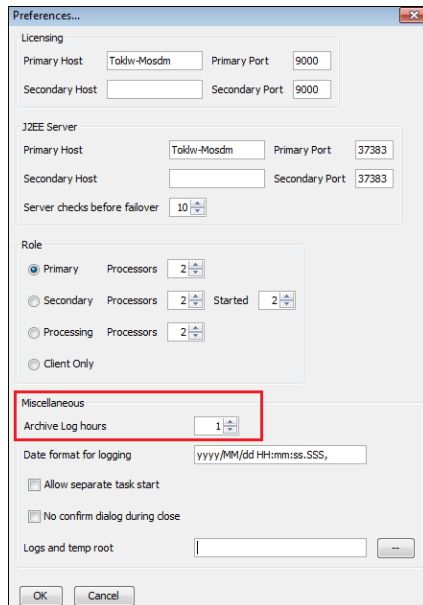

2. Check for the log folder locations at:

... \Program Files\Agfa\IntelliTune\code\archivlogs is a typical install location.

There is a new option added to Intellitune for Archive Logs in Launcher Preferences. This can be found in the Miscellaneous section and can be set from 0 to 960 hours. The default setting is 24 hours.

3. The screen capture above displays two logs created at 1:21pm and 2:21pm, the Archive Log hours is set to one hour. In addition to a zipped Log being archived each time the Launcher is started, a zipped log will be archived every hour.

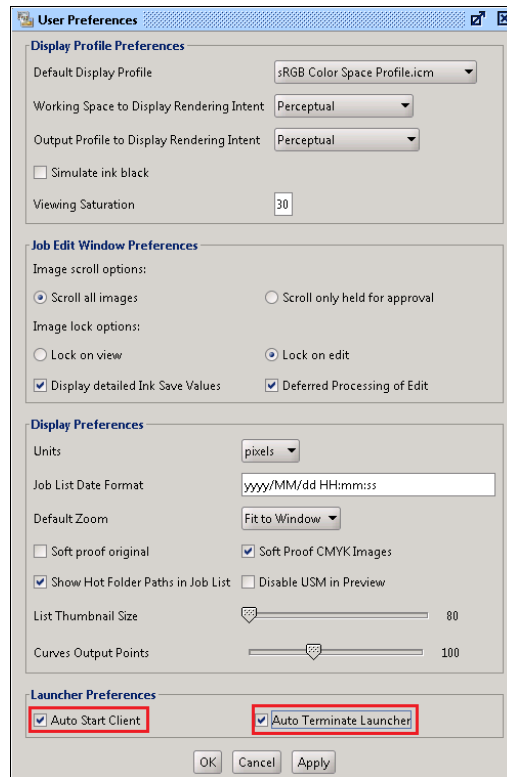

Client Only Mode

1. When operating in Client Only mode, the Launcher will exhibit the following behavior:
2. When the client is started manually, then the Launcher is automatically minimized.
3. Task Bar

4. When the client is started using **Auto Start Client**, then the Launcher starts off minimized. **AutoTerminate Launcher** applies only to client only machines and is designed to give direct access to the client from the desktop icon without the launcher remaining. So when selected and if the client is **auto-starting** then the launcher is removed.

5. When the client is exited and NOT in Auto Start Client mode, then the Launcher is automatically restored.
6. When the client is exited and IN Auto Start Client mode, then the Launcher is automatically closed.
7. When the Launcher is closed with the client running, then the client is automatically closed.
8. The Start All menu item is disabled in pure client mode.

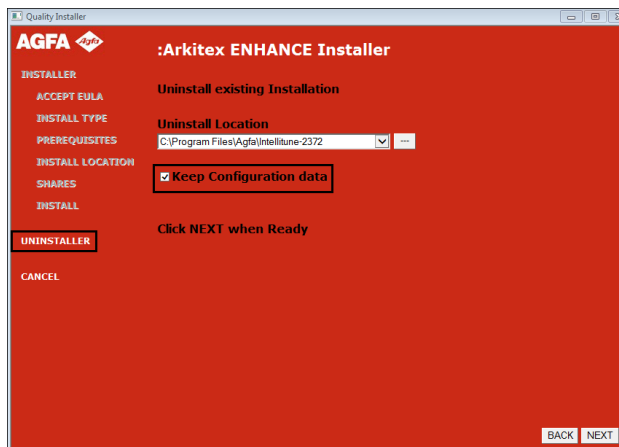

Uninstalling IntelliTune for earlier releases before 4.0

1. Should you have to reinstall IntelliTune, some manual clean-up will be required of remaining folders.
2. To Uninstall IntelliTuneX
3. Close the server Launcher to stop all processes.
4. Go to Start > Control Panel > Add/Remove Programs.
5. Select IntelliTune from the list.
6. Follow the prompts to uninstall the software.
7. Click Finish when done.

8. Close the Control Panel windows.

Do this for Release 4.1 and above to uninstall:

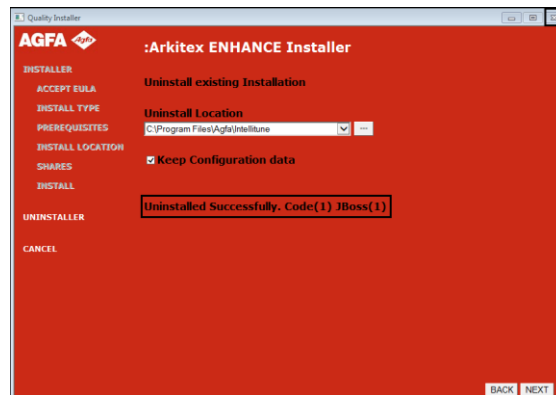

1. Insert CD or browse CD for Launcher.exe click on file
2. Click on Uninstaller
3. Select Uninstall Location
4. This shows a current install selector and an option to keep configuration files, which is useful if this folder, is to be re-used and the same set up is required.
5. Select Build to remove

6. Click Next

7. At the prompt you can answer Ok or Cancel
8. If Ok is answered

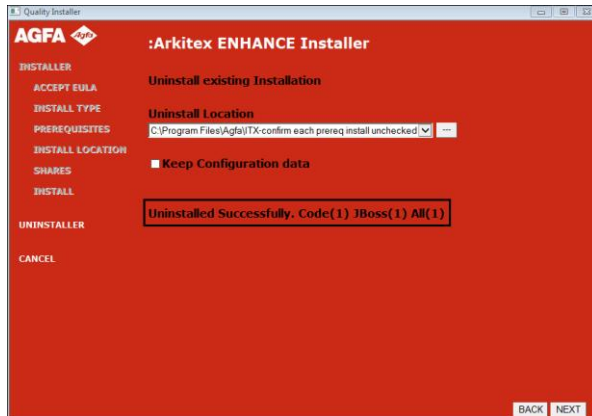

9. Code and Jboss folders are removed
10. Close application by clicking on the “X” in the right hand corner
11. The Config folder will remain for reuse and the same set up can be used

12. To remove all subfolders untick Keep Configuration data
13. Click Next

14. At the prompt you can answer Ok or Cancel
15. If Ok is answered

16. Information will display that Uninstalled Code, JBoss All.
17. Pressing the Next button performs the operation and returns to the same screen so that multiple uninstalls can be done.

8 Registration Utility and

8.1 ELMS Portal

This chapter is intended for the IntelliTune administrator. It describes the Registration Utility, Receipt Code, the ELMS Portal, Preflighting, and the License File.

Installing the Registration Utility

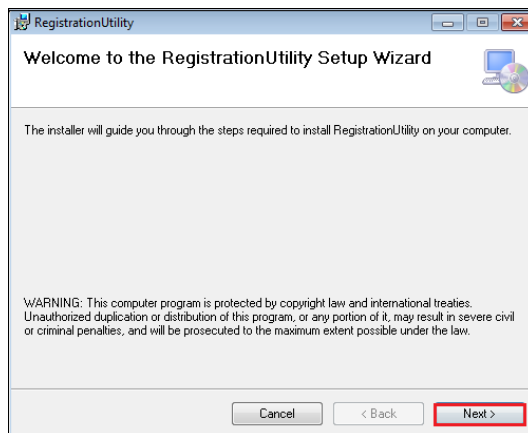

The Registration Utility is used to upload a License Request File and communicate with thegfa licensing server. In this case, the system should be running Windows Server 2008, Windows 2012, Windows 7, and Windows 8.

CAUTION: If the person installing the application has a full .ALF license already issued for the host computer, this application does not need installation.

1. The Registration Utility Installer can be found on the CD in the folder:

To Install the Registration Utility

2. Double-click the Setup.exe file to start the Installer.

3. Read the **Welcome Information** and click Next

4. Select an installation folder and click Next

5. Confirm Installation
6. Click Next
7. Installing RegistrationUtility
8. Screen will close

8.2 Checkout Receipt Code

Before creating a company account on the Agfa Licensing System (ELMS), you should do the following:

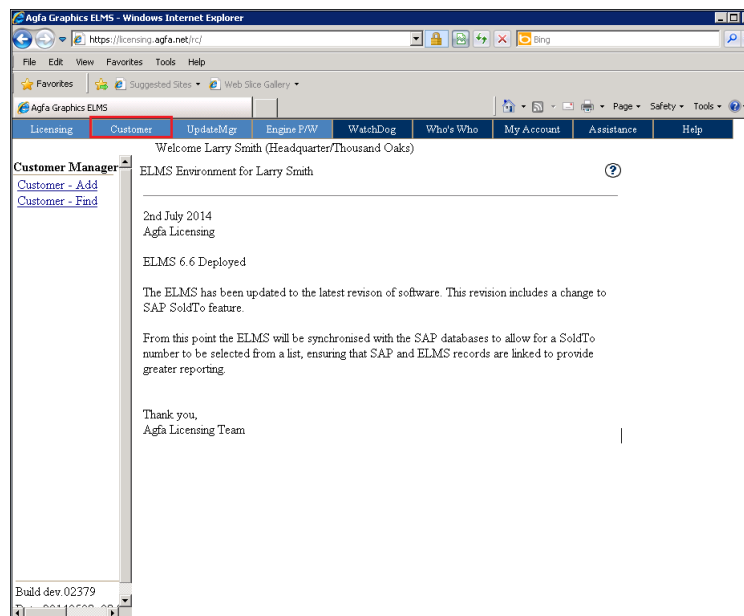

To Checkout the Receipt Code

1. Open your Web browser, and go to <https://licensing.agfa.net>.
2. Enter your User name and Password.

3. Click OK.
4. The Agfa ELM System is displayed.
5. Click the Licensing tab.
6. Under the Digital Warehouse Manager select Receipt Code Checkout.
7. Locate your customer Receipt Code ID under the heading Receipt Code.
8. Select the Receipt Code ID using the check box.
9. Press Continue.
10. If required, select PreFlight Selection. If not required, continue to the next step.
11. Select Create ReceiptCode File.
12. A file download will appear.
13. Save this ReceiptCode File to storage.
14. Continue to “Creating a Company Account on the ELMS Portal”

Creating a Company Account on the ELMS Portal

1. If there already is an account, the information will automatically populate the fields when the customer number is entered.
2. Open your Web browser, and go to <https://licensing.agfa.net/>.
3. Enter your User name and Password, and click OK.
4. The Agfa ELM System Portal is displayed.

5. Click the **Customer** tab.
6. Click **Add New**.
7. The **Customer Details** form displays.

The screenshot shows a web browser window titled "Agfa Graphics ELMS - Windows Internet Explorer" with the address bar displaying "https://licensing.agfa.net/ncj". The browser's menu bar includes File, Edit, View, Favorites, Tools, and Help. Below the menu bar is a toolbar with icons for Favorites, Suggested Sites, and Web Slice Gallery. The main content area has a navigation bar with tabs: Licensing, Customer, UpdateMgr, Engine P/W, WatchDog, Who's Who, My Account, Assistance, and Help. The "Customer" tab is selected, and the page displays a welcome message for "Larry Smith (Headquarter/Thousand Oaks)". The main heading is "Customer Portal - Create Customer", followed by the instruction "Enter the Customer details and press Add Customer". The form contains the following fields and controls:

- Customer WebId: Text input field with a "Check..." button to its right.
- Company Name: Text input field.
- Company Address: Text input field.
- Zip/Postal Code: Text input field.
- City: Text input field.
- State/Province: Text input field.
- Country: Dropdown menu with "-- Select One --".
- Office Allocation: Dropdown menu with "-- Select One --".
- or: Text label.
- First Name: Text input field.
- Middle Initial: Text input field.
- Last Name: Text input field.
- E-Mail: Text input field.
- Do Not Contact: Checkbox.
- Phone: Text input field.
- Ext: Text input field.
- "Add Customer" button at the bottom right.

At the bottom left of the form, the text "Build dev 02379" is visible.

8. Click **Check** to see if the **Customer WebID** already exists, and choose another one if necessary.

NOTE: WebID: customer name_mm_yy, with mm the month, and yy the year.

9. Complete the form, making sure that you enter a company e-mail address. This address will be used to send information on bug fixes, licensing, and new features.

10. Click **Submit**.

The account is created, and your **Customer Ticket** is displayed.

11. Receipt Code Files and PreFlighting

Your Receipt Code File (RCF) is provided by the Digital Warehouse Manager. The Receipt Code groups together sales order codes for your particular installation or system upgrade. You can validate a Receipt Code File by preflighting it. This process: Checks up-front whether or not a license can be successfully generated:

for a complete system (new installation or upgrade)

for new options on an existing configuration

If the preflight is successful, a PreFlight Information section is added to the RCF, possibly with warnings. If the preflight fails, then the RCF file is not updated with the PreFlight Information section.

Locating and Verifying your Receipt Code File

Make sure you have the Receipt Code File before visiting the customer site. You will need to specify where this file is located when you run the Registration Utility.

RCFs and PreFlight Reports

If the Digital Warehouse Manager (Agfa Sales Office) preflighted the Receipt Codes when they were checked out, the RCF contains the results of this validation.

If there is no 'PreFlight Information' section in the RCF, you can perform the preflight yourself prior to going to the customer.

To verify your RCF using a web browser

1. Open the RCF in a web browser.
2. Locate the PreFlight Information section.

If this section exists and no warnings are displayed, then the file is OK. Other- wise, you must ask your Digital Warehouse Manager for a preflighted RCF.

To verify your RCF using the Registration Utility (new installation)

3. Start the Registration Utility (version 4.7.0.1 or later).
4. Select File > Open, and choose a Fingerprint File.
5. Select File > Add, and select the RCF File.

If no warnings are displayed, the RCF has already been successfully preflighted.

To verify your RCF using the Registration Utility (existing installation)

In this case, the RCF already contains options for an existing configuration.

6. Start the **Registration Utility** (version 4.6.0.1 or later).
7. Select **File > Open**, and choose the latest License File for this configuration.
8. Select **File > Add**, and select the RCF File.

NOTE: If no warnings are displayed, the RCF has already been successfully preflighted for this particular configuration.

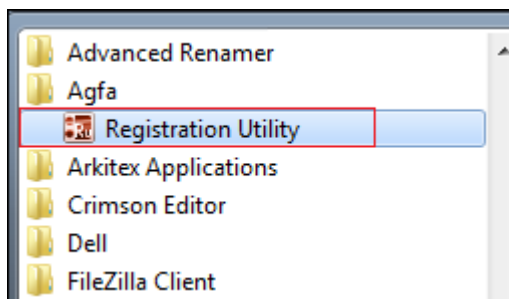

Creating an IntelliTune License File

Using the Registration Utility, merge the Fingerprint and Receipt Code File into the License Request File.

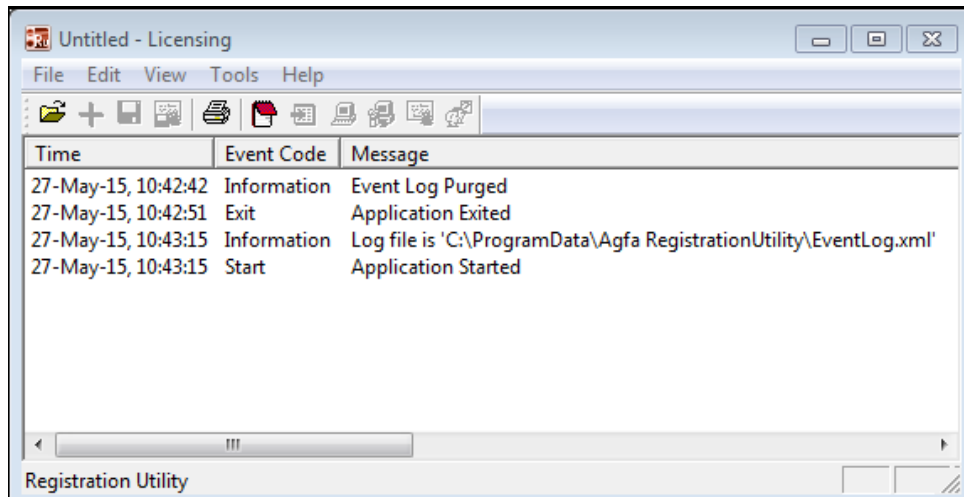

NOTE: You should already have a Receipt Code File. You must also have the latest version of the Registration Utility installed

To upload LRF and generate a License File

1. Go to Start > All Programs > Agfa > Registration Utility.

2. The Registration Utility window displays.

3. Select File > Open, and browse to the location of the Fingerprint File that you just generated (extension *.fpf).
4. Click the License File in the Configuration Details to download the License File.
5. Click OK to save this file to disk.
6. Select a location, and click Save.
7. Click Close.

Using the Registration Utility in 'Offline' Mode

This section describes how to create a License Request File and upload it to the Agfa ELM System Portal. With the uploaded License Request File, you can then generate a License File. This License File will be downloaded from the Agfa ELM System Portal.

To create a License Request File

1. Start the Registration Utility.
2. Select File > Open, and browse to the location of the Fingerprint File that you just generated (extension *.fpf).
3. Click Open.
4. The file is listed in the Message field.
5. Select File > Add, and browse to the location of your Receipt Code File
6. (extension *.rcf).
7. Click Open.
8. A message may pop up indicating that the Receipt Code File was either not
9. PreFlighted when it was checked out, or has some PreFlight warnings.

10. In this case, click Yes if you are confident that it will be OK. If you have any doubts, click
11. No and ask for a new preflighted Receipt Code File from your Digital Warehouse Manager.
12. The file is listed in the Message field.
13. Select View > Customer Details.
14. Enter the user name (WebID).
15. Select File > Create LRF (License Request File), and browse to the folder where you want to generate the License Request File (extension *.lrf).
16. Enter a filename, and click Save to generate and save the License Request File.
17. This operation is confirmed in the Message field.
18. Select File > Exit to close the Registration Utility.

To download a License File from the Agfa ELM System Portal

NOTE: This can only be done by an Agfa Service Engineer.

1. Open your Web browser, and go to <https://licensing.agfa.net/rc>.
2. Enter your User Name and Password, and click OK.
3. Your Licensing System Portal is displayed.
4. Click Licensing.
5. Under the Registration Manager, select License File > Create.
6. You are prompted to upload the License Request File.
7. Click Browse, and locate your License Request File.
8. Select the License Request File, and click Open.

NOTE: The License Request File has an *.lrf extension.

9. Click Create License File.
10. If the License File is successfully generated, you will see the following screen briefly.
11. The download window for the IntelliTune License File appears automatically.
12. Click Save to proceed.
13. Select a location that can be accessed by the IntelliTune Client.
14. You should save your License File(s) in: ... \Agfa\IntelliTune\SupportFiles\Licensing info
15. Click Save.
16. If the License downloading fails due to network problems, use the My Recent
17. License Files link under the Registration Manager.

Backup Licensing

IntelliTune uses the standard Agfa ELMS based Licensing service. When the service is available, the control of all product options are managed by the service. If the dongle protecting the licence fails, the service manages this by operating in a Grace period. There is no properly managed process for handling failures of the Licensing service itself. This becomes particularly critical when multiple platform instances of the product share a

common Licensing service. If this fails, then potentially all instances will fail at the same time. Currently this is managed by a local short-term pseudo-grace mode of operation. Automatic fail- over to an enhanced pseudo-grace service is explained.

Enhanced Backup Licensing

Enhanced Backup Licensing is used in a multi-platform environment. IntelliTune uses the standard Agfa ELMS based Licensing service. When the service is available the control of all the product options are managed by the service. If the dongle protecting the license fails, the service manages this by operating in a Grace period.

The Enhanced Backup Licensing is designed to manage failures of the Licensing service itself.

LicenseServiceLog.xml

The installer implements logging as part of the prerequisites installed. The log file is LicenseServiceLog.xml and is located at:

Windows 7 and Windows 2008

C:\ProgramData\Agfa Graphics

Windows 2008

C:\Documents and Settings\All Users\Application Data\Agfa Graphics

LicenseServiceLog.xml can be opened with Internet Explorer and will use the associated style sheet log.xsl to give a tabular log view.

9 Primary and Secondary Servers

Configuring the Servers

Primary/Secondary

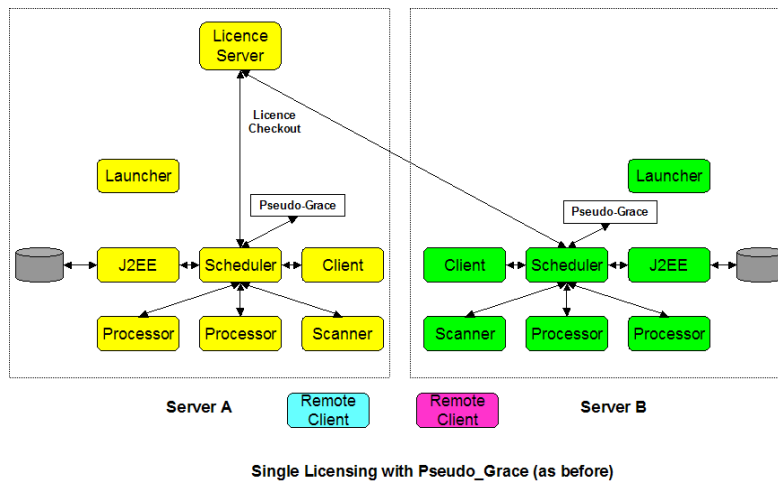

Primary/Secondary Licensing and Primary/Secondary Server are two different and independent features.
 ... Primary/Secondary Licensing can be used without using Primary Secondary Servers.
 ... Primary/Secondary Servers can be used without Primary/Secondary Licensing.
 ... Primary and Secondary Licensing and Servers can be used together.

Primary/Secondary Licensing

This is a feature to provide a back up mechanism for Licensing where one or more servers are controlled from one Licensing alf file. It is a more controlled replacement for the previous pseudo-grace functionality.

Two Licensing platforms (Primary/Secondary) share the same Licensing information and exchange information to provide a non-stop Licensing service in the event of one platform failure.

Single Licensing with Pseudo-Grace

Server B

Primary Secondary Licensing

Primary Secondary Licensing

Server A

Server B

1. Each independent server checks out its Licenses from the Primary Licensing service.
2. Primary and Secondary Licensing machines exchange information so they each know what Licenses
3. are checked out.

4. If the Primary Licensing service becomes unavailable, the schedulers automatically switch to the
5. Secondary Licensing service and continue un- interrupted operation.
6. Even if the Primary Licensing is not available at start up, then the
7. Secondary Licensing will be used.
8. Unless both Primary and Secondary Licensing services are running AND can communicate with each
9. Other then the Licensing is graced until normal dual operation is restored.
10. Any number of servers can share the same Primary/Secondary Licensing set up.

NOTE: Normally the Primary and Secondary Licensing should be on the same subnet to communicate.

Fingerprinting

1. Fingerprint is still controlled from one License management operation; but two fingerprints are
2. requested in sequence.
3. If using a dongled fingerprint, the dongle should be on the Primary server.
4. The secondary fingerprint is automatically made PKP.
5. The Fingerprints are combined in the Registration utility.

Loading

1. Loading is single alf constructed, which contains both fingerprints and one set of
2. Licenses.
3. Licensing management is loaded on one platform, but automatically loaded onto both Licensing services.
4. An alternative server set up to provide:
5. Centralized load balancing
6. A single database for client logging and centralized job tracking
7. Automated fail-over to a Secondary server
8. Two Server Licenses needed to License a primary/secondary pair

Platforms can now be set up in 1 of 4 roles:

Primary

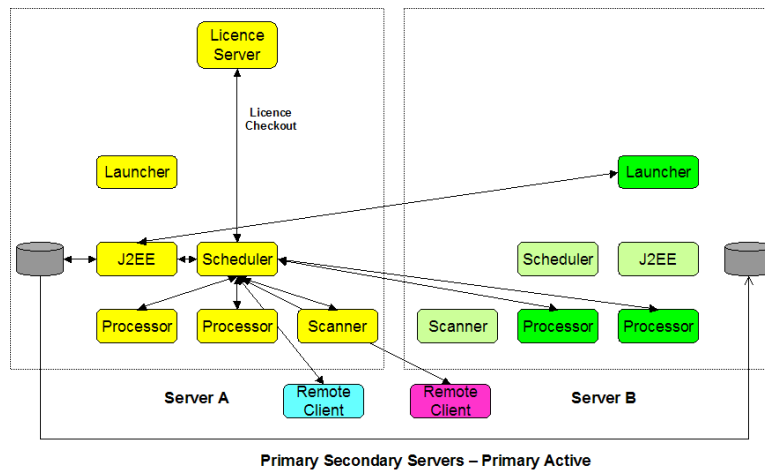

1. Active JBOSS, Scheduler
2. Optional Processors and client

Secondary

3. Back up JBOSS, Scheduler
4. Optional Processors and client
5. Processing
6. Processing units and optional client
7. Pure client

„ Processors are now properly licensed. Default is 4 per server bought.

Primary Secondary Servers - Primary Active

Primary Secondary Servers - Setup

The image shows two side-by-side screenshots of the 'Preferences...' dialog box for Server A and Server B. Both windows have the same layout and settings, with the role selection circled in red.

Server A Preferences:

- Licensing:** Primary Host: ServerA, Primary Port: 9000, Secondary Host: , Secondary Port: 9000.
- J2EE Server:** Primary Host: ServerA, Primary Port: 37383, Secondary Host: ServerB, Secondary Port: 37383, Server checks before failover: 10.
- Role:** ☒ Primary, Processors: 2, Started: 2.
- Miscellaneous:** Archive Log hours: 24, Date format for logging: yyyy/MM/dd HH:mm:ss.SSS, Allow separate task start: ☐, No confirm dialog during close: ☐, Logs and temp root: .

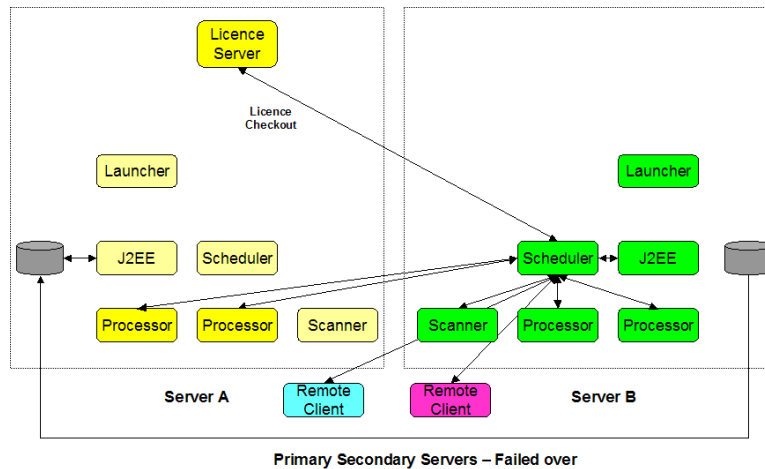

Server B Preferences:

- Licensing:** Primary Host: ServerA, Primary Port: 9000, Secondary Host: , Secondary Port: 9000.
- J2EE Server:** Primary Host: ServerA, Primary Port: 37383, Secondary Host: ServerB, Secondary Port: 37383, Server checks before failover: 10.
- Role:** ☒ Secondary, Processors: 2, Started: 2.
- Miscellaneous:** Archive Log hours: 24, Date format for logging: yyyy/MM/dd HH:mm:ss.SSS, Allow separate task start: ☐, No confirm dialog during close: ☐, Logs and temp root: .

Server A**Server B**

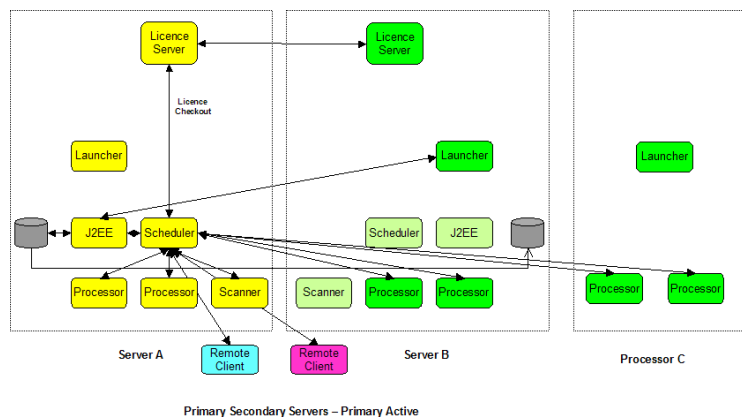

1. The Primary Server normally runs the Database J2EE, Scheduler and some processors, backs up files, database /config to secondary periodically (default 5 minutes).
2. The Secondary normally runs processors, which just connect to the primary machine.
3. If the Secondary Launcher detects the Primary has failed, it initiates a fail-over automatically.
4. The Secondary starts up its J2EE database / scheduler.
5. The Processors and clients automatically find the working server (Primary/Secondary) and autonomously follow any fail-over operation.

Primary Secondary Servers - Failed Over

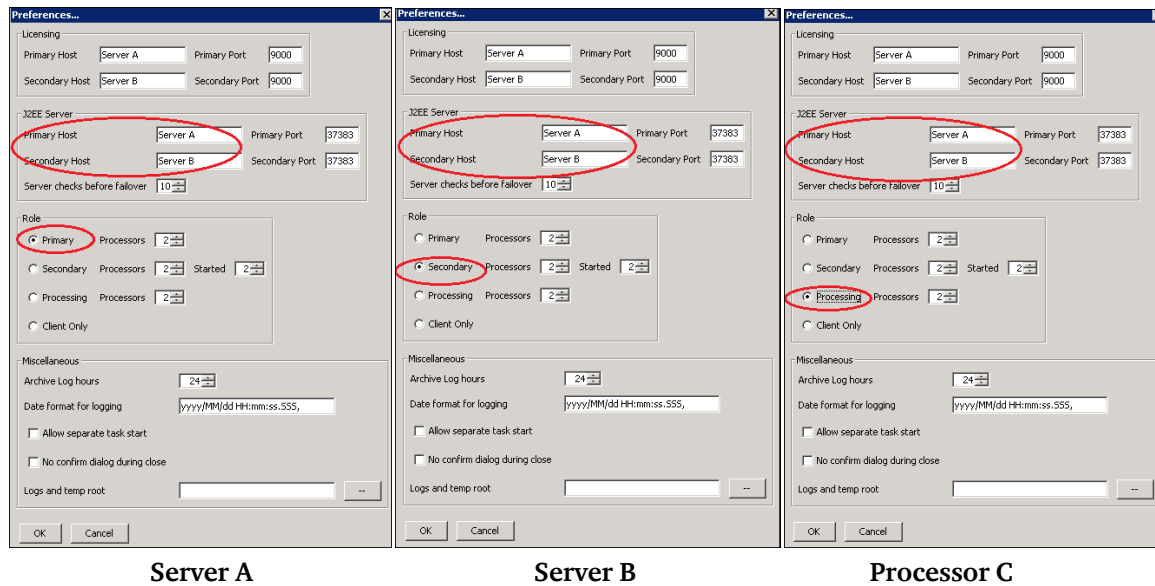

6. Normally the Primary platform would fail completely and the Secondary would continue with its own resources.
7. Detection of failure and the failover operation can take 4 to 5 minutes.
8. If pure Processing platforms are defined, they will connect automatically to the active server whether it be the Primary or the Secondary.
9. Most times the Primary/Secondary Server systems will be set up as the Primary/ Secondary Licensing systems as well.

Primary Secondary Servers - Primary Active

Primary Secondary Servers - Setup

It is best to make sure that the number of processors on a server platform is less than the number of CPU cores to make sure that the scheduler has some spare capacity; e.g., Quad core set up for 2 or 3 processors.

„ Currently a scheduler becomes a bottleneck when more then 8 processors are active across all the platforms.

„ If more than 8 processors are wanted for high throughput, it is best to use separate servers.

9.1 Configuring Producer and Intellitune with PDF option

Method 1 - Producer

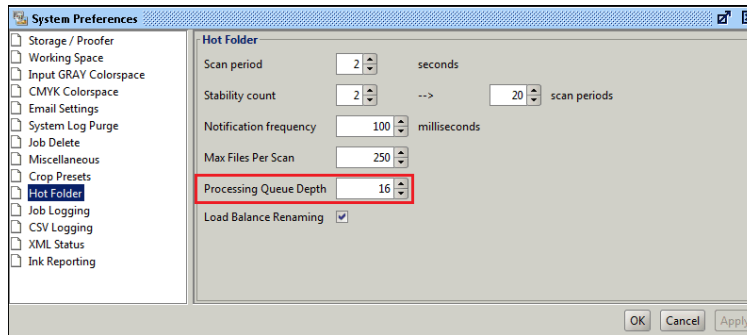

1. „ Producer equally shares work to multiple Servers.
2. „ Well controlled load sharing is achieve via XML feedback.
3. „ There is some degree of centralized tracking at Producer.
4. „ Clients have to log on to each server for detailed tracking.
5. „ This method is highly scaleable, and needs a Producer system.
- 1.
- 2.

Method 2 - Folder Sharing

6. „ The Servers monitor common hot folders.

7. „ Set small queue
8. ... $\text{ProcessQueueDepth} = \text{Processors} + 2$ (change can be made in System Preferences)

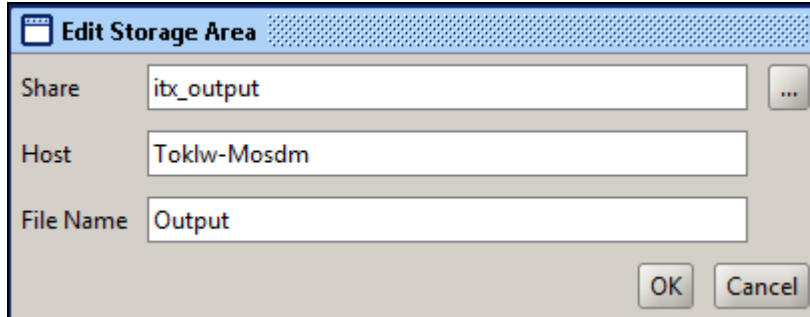

9. ... Servers "purge" jobs that get picked up by other servers
10. „ Clients have to log on to each server for detailed tracking.
11. „ No other products are needed.
12. „ Do not use for more than 3 servers.

Method 3 - Single Server

13. „ A single server monitors hot folders and schedules jobs.
14. „ Secondary and/ or Processor platforms add processors that share the work.
15. „ Clients log on to the one server for full central detailed tracking.

Hotfolders Storage Areas

Two basic techniques in Primary/Secondary.

16. „ Put on the server and let them automatically swap during fail-over.
17. ... This is easy to set up.
18. ... This needs data external feeds and collection to be aware of the dual system. Or use a proxy set up.

Out on a secure network storage point (SAN)

... This needs external storage.

... This can be very secure.

... This minimizes swap over complicity.

Hot folders defined as local to Server are stored as localhost in the database and translated to the physical machine when read.

Hints and Tips

Primary Secondary Licensing across sub-nets

... Normally the servers auto-discover their partners by broadcast search.

This does not work across sub-nets without special router configuration.

This can be overridden by putting the remotePartnerIP:port number where the port number is 9000 in the LicenseService_Public.Config.xml file explicitly.

```
remotePartner="192.168.1.2:9000"
```

Primary Server

On the Primary server, do the following:

Configure Preferences

Preferences...

Licensing

Primary Host: VMX4-Mickey Primary Port: 9000

Secondary Host: vmr9-itx3 Secondary Port: 9000

J2EE Server

Primary Host: VMX4-Mickey Primary Port: 37383

Secondary Host: vmr9-itx3 Secondary Port: 37383

Server checks before failover: 10

Role

☒ Primary Processors: 2

☐ Secondary Processors: 2 Started: 2

☐ Processing Processors: 2

☐ Client Only

Miscellaneous

Archive Log hours: 24

Date format for logging: yyyy/MM/dd HH:mm:ss.SSS

☐ Allow separate task start

☐ No confirm dialog during close

Logs and temp root:

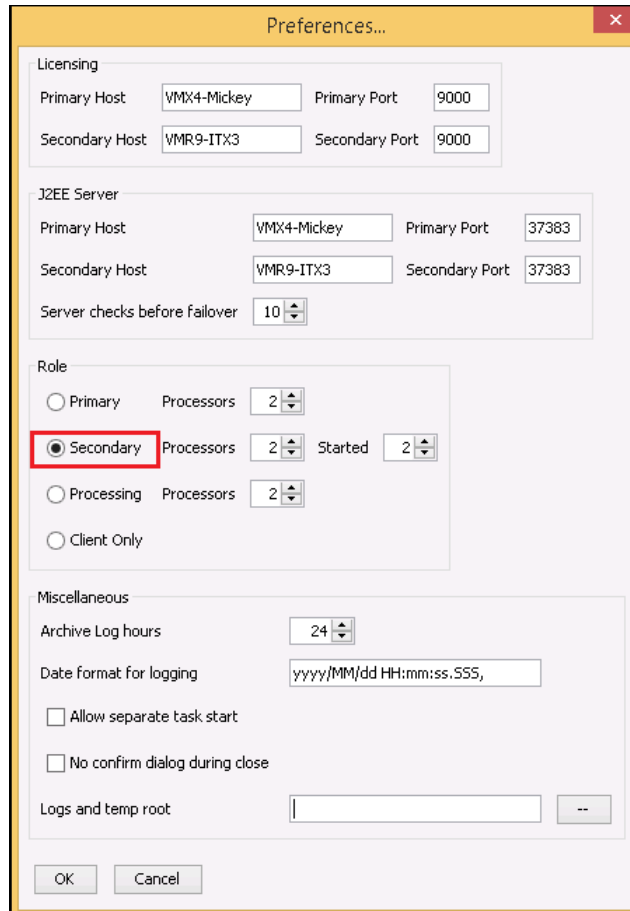

OK Cancel

1. In the IntelliTune Launcher select File > Preferences.
2. Enter the **Primary** host name and **secondary** host name, in Licensing section, and in the J2EE section.
3. Enter the Role, click on **Primary**
4. Click OK to exit the window.

Secondary Server

On the Secondary server, do the following:

Configure Preferences

1. In IntelliTune Launcher go to **File > Preferences**.
2. Enter the **Primary** host name and **secondary** host name, in Licensing section, and in the J2EE section.
3. Enter the Role, click on **Secondary**
4. Click OK to exit the window.

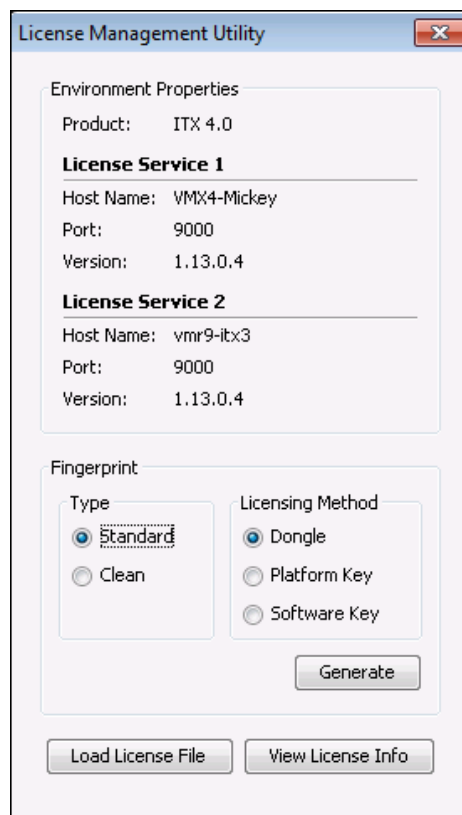

Licensing

For licensing, do the following:

Generate Clean Fingerprint

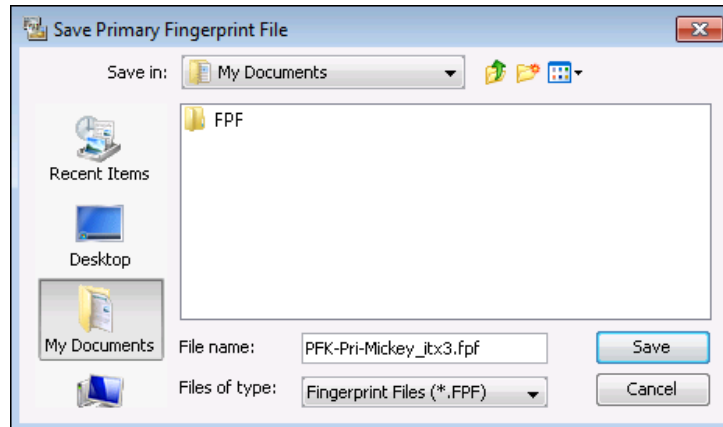

Do the following on the Primary Server

1. Start the IntelliTune Launcher, and go to **Licensing > License Management**.

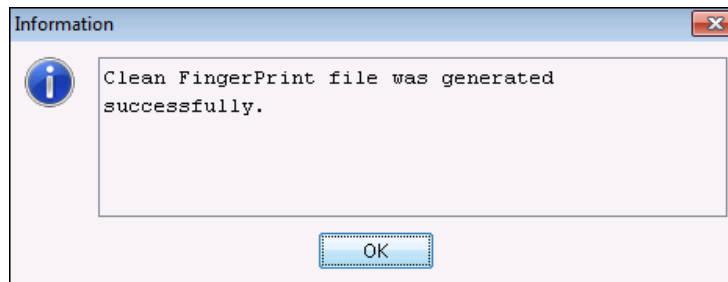

NOTE: The dialog will display the Product Version, Licensing Service 1 information, and Licensing Service 2 information.

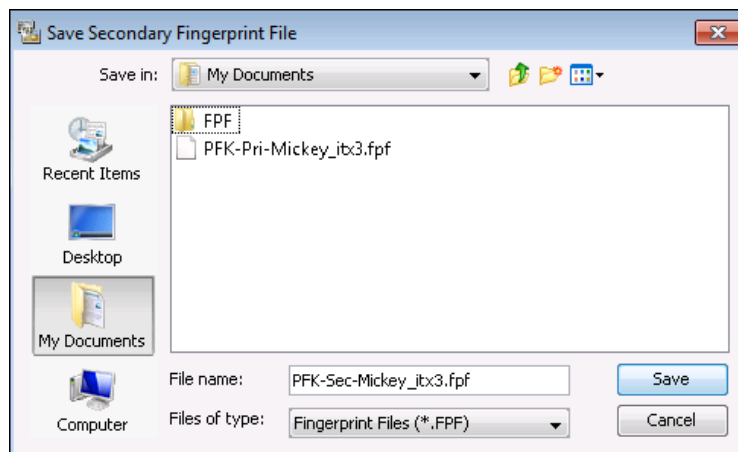

2. In the Fingerprint Type, select **Clean**.
3. In Licensing Method, select **Dongle**.
4. Click **Generate**.

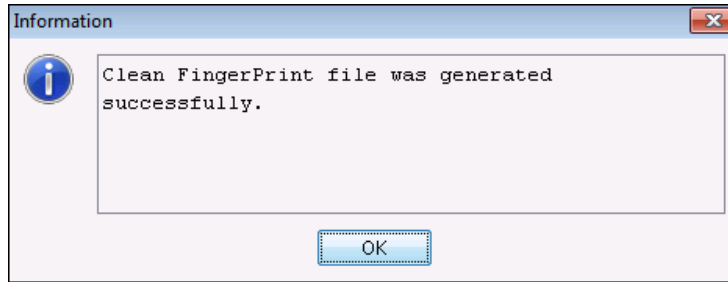

5. In the **Save Primary Fingerprint File dialog**, create a file name for the fingerprint (FPF) in the File Name field.
6. Save to an accessible location, such as My Documents.

7. The information window will display the status that the FPF was created successfully. Click **OK**.
8. The **Save Secondary Fingerprint File dialog** will display.

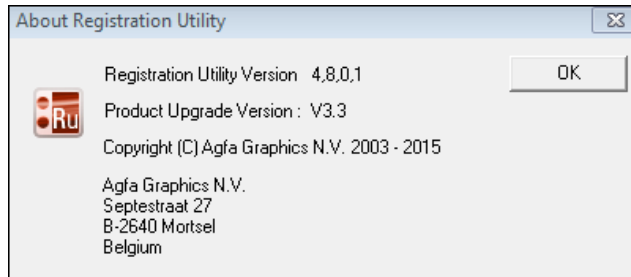

9. Create a file name for the FPF in the File Name field, and **save** to an accessible location.

10. The information window will display the status that the FPF was created successfully.
11. Close the information window, click **Ok**.

Registration Utility

1. Open the Registration Utility 4801.

2. In the Registration Utility 4801 or higher, select **File > Open FPF**.
3. Select the file name for the **Primary server**.
4. Select the Server FPF, and click on **Open**, if needed.

5. The Information window displays the option for working in a **failover** environment (PKP). Select **Yes**.
6. The dialog for selecting the **Secondary Server** FPF file name is displayed.
7. Select the file name, and click on **Open**, if needed.
8. In the File Menu, select **Add receipt code** to open the dialog.

9. In the Open RCF dialog, browse to the location of the Receipt Code File (RCF), and click the RCF file name. Click Open, if needed.
10. The Licensing dialog is displayed.
11. If the RCF is a preflight type, you can choose Yes to continue.
12. If the RCF is not a preflight type, you can also choose Yes to continue.
13. Choose No if you want to stop the process and arrange for a preflight RCF type.
14. You may add the Web ID, if needed.
15. To add the Web ID, select View > Customer Details.

The screenshot shows a software window titled 'Licensing' with a menu bar (File, Edit, View, Tools, Help) and a toolbar. The main area is divided into two sections: 'Customer Info' and 'Contacts'.

Customer Info section contains the following fields:

- Customer ID: [Empty text box]
- WebID: <https://licensing.agla.net/>
- Name: [Empty text box]
- Address1: [Empty text box]
- Address2: [Empty text box]
- Zip: [Empty text box]
- City: [Empty text box]
- State: [Empty text box]
- Country: [Empty text box]

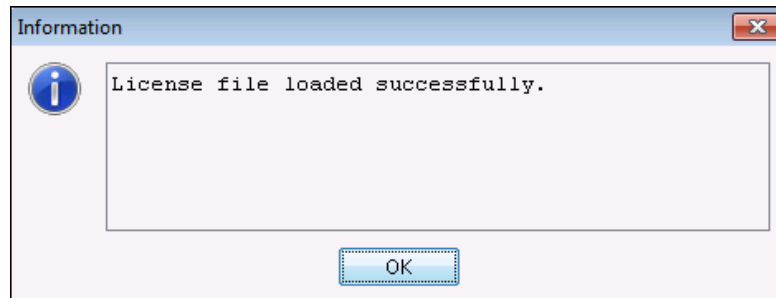

Contacts section contains a table with the following columns: First, Middle, Last, Email, and Phone. The table is currently empty.

16. **Select File > Upload License LRF.** The License Server Login window will display.
17. Enter the login information, and click OK. You will connect to the license server.
18. The License Request File (LRF) is uploaded to the licensing server. A
19. status window will display.
20. If the LRF upload succeeded, the License File (ALF) license file will be available for download. The ALF file can be saved with an optional file name of your choosing. A default ALF file name is also available.
21. Download the ALF file to an accessible location on the local computer. (For example, My Documents is suitable for storing the ALF license file.)
22. If the LRF upload failed, note the status window error message and correct any problems. FPF generation or RCF integrity may cause issues with LRF uploading.

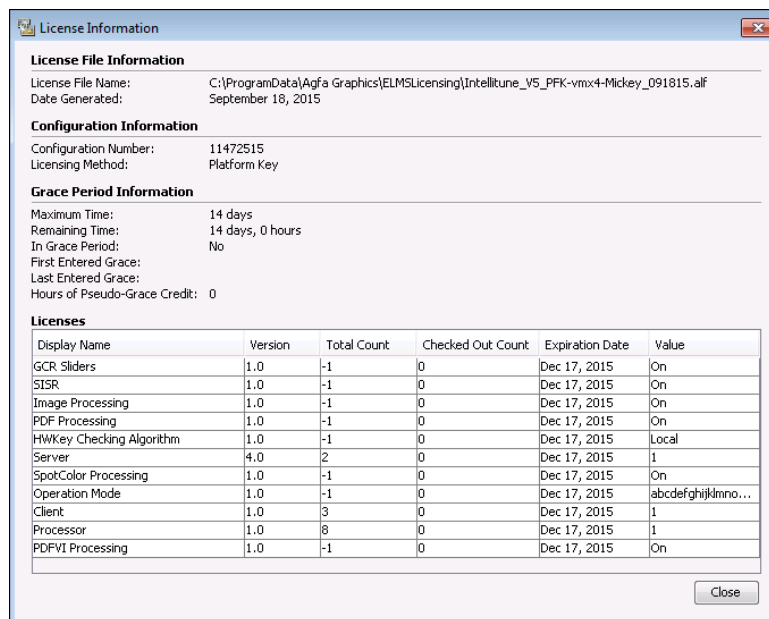

On the Primary server, do the following:

1. Start the IntelliTune Launcher, and go to **Licensing > License Management**.
2. Select Load License File.

3. In the Load License File dialog, browse to and select the ALF file name. Click Open, if needed.
4. The ALF license is loaded on the Primary and Secondary server. The dialogue box will display for Primary then Secondary.

5. Click Ok to License file loaded successfully
6. To check the license status, start the Launcher processes on the Primary and Secondary server.
7. Select Licensing > License Management. Click on **View License Info**. The dialog displayed is a view of the licensing version, Total Count for options, Checked out count by the license, expiration date and Value.

Servers Status

The IntelliTune Primary and Secondary servers are designated and connected to the network.

Both servers are installed with IntelliTune 5.0.

The IntelliTune Primary and Secondary servers are installed with IntelliTune, configured, and connected to the network.

Primary server configuration - Enter this information before configuring the Secondary server. In the IntelliTune Launcher go to File > Preferences, and enter the primary and secondary host IP or hostname in the Licensing section, and in the J2EE section.

Secondary server configuration - In the IntelliTune Launcher go to File > Preferences, enter the secondary host IP or hostname in the Licensing section, and in the J2EE section. (The Primary Licensing information is already applied. Enter information if it is not already applied.) Click OK to exit the window. You must restart the IntelliTune Launcher to apply the configuration settings.

A dongle is installed on the Primary server.

The license for Primary and Secondary servers is installed. The license is installed on the Primary server AFTER the primary and secondary are both configured. The license is automatically copied through the network to the secondary server. No action to install license is needed on the secondary server. See section for Installing license.

The IntelliTune Launcher window and processes of the Primary server are running.

The Launcher window of the Secondary server is running.

The Processes of the Secondary server can be running or not running. If processes are running, the Secondary server will share in the job processing of a portion of the jobs input to the Primary server.

Assure that file synchronization is occurring between the Primary and Secondary server. To verify, check the Primary Server Scheduler log. It will display synchronization log entries that identify the Primary and Secondary server.

If the Primary and Secondary servers have been in operation as stand-alone servers, a license that supports primary and secondary operation can be obtained and installed. The new license will supersede the previous license.

Failover from Primary to the Secondary server

If the Secondary server cannot contact the Primary server through the network, the Secondary server will begin the failover process. The Secondary server will assume the role as Primary server upon completion of the automatic shutdown and restart process.

The Secondary server will operate with the configuration that has been previously set. The Secondary server will not "inherit" image processors from the Primary server. For example, if the Primary server has 4 image processors, and the Secondary server is configured for 2 processors, the Secondary server will operate with 2 processors when it assumes the role as the Primary server.

When the Primary server resumes operation, the secondary server can return to the role of secondary server. A manual shutdown of the Secondary server is required to accomplish this.

Secondary Server Operation

The Secondary server can run with image processes started and share the job processing workload of the Primary server. In this scenario, the Secondary server has not assumed the role of Primary server, but is in a stand-by status.

When the Primary server fails, the Secondary server automatically restarts in the configuration of a Primary server. Automatic restarting of the Secondary server Launcher occurs if Launcher processes are running or not running.

The automatic file synchronization between the Primary and Secondary server will maintain the configuration of the Secondary server. Workflows, input points, and storage locations are identical on both servers. However, the Secondary server is normally running on a different host system. When the Secondary server takes over the role of the Primary server, the network workflow will need to be adjusted for the new host system. Applications may need to redirect jobs to inputs on the new host, and completed jobs are also relocated to the new host.

Primary Server Licensing Considerations

If the license of the Primary server expires, the Primary and the Secondary server will enter a grace period. The IntelliTune Launcher and the client will display this status. Installing a valid license will restore normal operation to both servers.

If the Primary server loses network contact with the licensing service of the Secondary server, the Primary and Secondary server will enter a grace period. Normal operation of both servers will resume when network contact is restored.

If the Secondary server loses network contact with the licensing service of the Primary server, the Primary and Secondary server will enter a grace period. Both servers will resume normal operations when network contact is restored.

Restoring the Primary Server After Failure

Start the Primary server Launcher, and install a valid license, if needed. Use the Maintenance menu selection to "Remove jobs and logs". Check the IntelliTune share folder (typically `c:\itx_filestore\stable`), and manually delete orphaned jobs found there.

Let all local job processing finish on the Secondary server before starting processes on the partner Primary server.

OR

As an alternate step, the Primary server should be configured as a stand-alone server if the Secondary server is processing jobs. After the Secondary server finishes job processing, the Primary server can be

configured with the Secondary server settings, and the Secondary server can then be restarted. When the Secondary server restarts, it will resume operating in the Secondary server role.

Manual Failover operation

Manual failover is achieved in 2 stages.

1. First if the Master platform is still available, then the user should place it in the Secondary Server Backup platform mode if a role swap is required, or shut it down if it should no longer participate in the system. In both cases the scheduler, J2EE, and scanner functions should all cease to be active and any connections from clients, and processors should be dropped. Processors are allowed to remain active on this platform when making this role change, although they cannot do any useful work until they have reconnected to an operational scheduler.
2. As a second stage, the user should place the Secondary Server Backup platform into a Master role. This should only be allowed to proceed if there is no operational connection to the previous Master. The Secondary Server Backup platform entering a Master role must start its J2EE, scheduler, and scanner components. It should attempt to check in any existing Licences from the Licence persistence file (i.e., from the previous Master). It should checkout Licences, and then enter an operational role and honor connection requests from the other components on its own and other platforms. It will then be scheduling and managing jobs using the currently synchronized database and jobs filestore.
3. After the first stage of a Master platform failure all remaining components and clients will be attempting to repeatedly reconnect with their configured primary and secondary configuration. After the second stage with an operational new Master, they should succeed in remaking this connection resulting in a new operational system with whatever components are still functional.

Automatic Failover operation

As an optional configuration an automated detect and failover process may be activated. It is recommended that the manual process be used where possible as being simpler and more straightforward. The automated process is intended for configurations that are unattended.

Failover Trigger

1. The Secondary Server Backup platform is the platform responsible for detecting a reason to initiate Automatic failover.
2. When operating as a Secondary Server Backup platform, it should attempt to check the JBOSS component on the Master platform every 30 seconds. If successful then the Secondary Server Backup platform remains in its back up role and continues to monitor the Master platform in the same way.
3. If the Secondary Server Backup platform detects the JBOSS has stopped on the Master server, then it should retry 10 times at 30 second intervals to make this connection before initiating a Failover trigger.

If any of these attempts succeeds, then the Secondary Server Backup platform reverts to normal monitoring.

Automatic Failover Action

1. When a Secondary Server Backup platform triggers automatic failure, then it should first attempt to issue a remote shutdown of the application processes on the existing Master platform. If this fails, then it should attempt to issue a complete platform shutdown on the Master platform. These steps try to ensure that there are no components left running on the Master that might interfere with successful operation.
2. The Secondary Server Backup platform should then initiate automatically a role swap to Master Platform just like in the manual procedure. Components on its platform and other remaining platforms will reconnect to the new Master automatically.

IntelliTune Grace Period

A system can go into grace period unexpectedly for one of several reasons. The procedure for diagnosing it is as follows:

To Check the license

Check the expiry date and options of the license from the Launcher menu. If no options are present, reinstall the license file. If it is expired, a new license is required.

To Check the Wibu Driver

Open WIBU-KEY item in the Windows Control Panel, and check the about box. If there is no WIBU-KEY entry, re-install the driver from the install disk.

To Check the dongle

Using the WIBU-KEY item in the Windows Control Panel, check the serial number for the dongle, as displayed in the Contents tab. This serial number is also written on the dongle itself. If there is no serial number, the dongle is defective. A new one must be obtained within the grace period.

To Check that the correct dongle and license file are being used

Both the dongle and license file (*.alf) must match the MAC address of the PC. The alf file is in XML format. Open it in a text editor, or XML viewer (such as Internet Explorer).

Obtain the MAC address of the PC by running:

ipconfig /all

from the command line. The MAC address is referred to as the Physical Address. Check that this matches the HardwareKey entry in the alf file. Check that the dongle serial number (written on the dongle) matches thenSerialNr entry in the Dongle section of the alf file.

NOTE: The MAC address will change if a new network card is installed in the PC, and the dongle and license will then cease to work.

NOTE: The MAC address can also change if the PC is switched between VPN and non-VPN access (under VPN it acquires a virtual MAC address).

Interface to :Arkitex

9.2 LogViewer

This document describes the interface between IntelliTune Arkitex LogViewer. To install LogViewer, refer to the Import Events Setup section in the LogViewer User Guide (CG+0949710001).

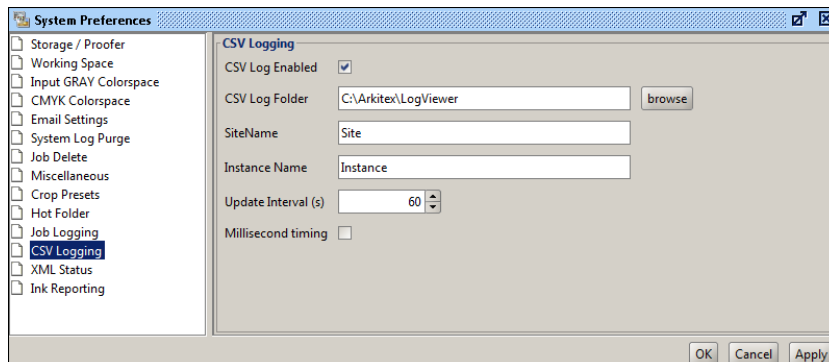

NOTE: Set the filter in the Import Events Setup to .csv.

Interface Overview

1. When the LogViewer interface is enabled, IntelliTune will periodically write out event log files to a specified folder in LogViewer CSV format.
2. The folder must be local to the IntelliTune server PC. IntelliTune will accumulate events for a short period (e.g., 60 seconds), then write out a new log file containing all the events that occurred during that period. If no events occurred, no log will be generated.
3. It is the responsibility of LogViewer to remove the files when they have been read.

Setting up the Interface

The interface is configured by editing the CSV Logging in System Preferences

9.3 Interface to Arkitex BonderExt

This document describes the interface between IntelliTune and Arkitex BonderExt.

IntelliTune / Arkitex BonderExt

The Arkitex BonderExt service provides a method to interface from a Producer TCP/IP socket to IntelliTune input folders. The IntelliTune System Preferences needs to be opened to enable the creation of the Intellitune.xml status file.

9.4 Installing Producer to External Applications Interface

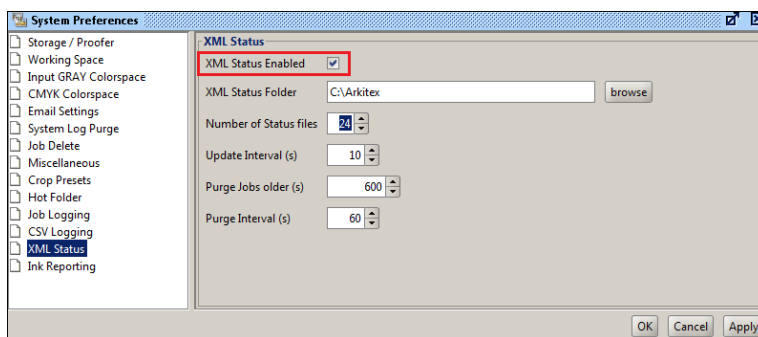

The External Applications Interface is a plug-in available in Producer located on the Arkitex Workflow Installation DVD.

Enabling the Arkitex Status Option

1. Launch IntelliTune
2. Select Start
3. Click on all task
4. Start Client after all task are started
5. Login to Client
6. Select System Preferences Icon

7. Select XML Status
8. Click on XML Status Enabled
9. Default Folder is XML Status Folder **C:\Arkitex**
10. Number of Status Files is 1 to 24
11. Leave other settings set to default settings

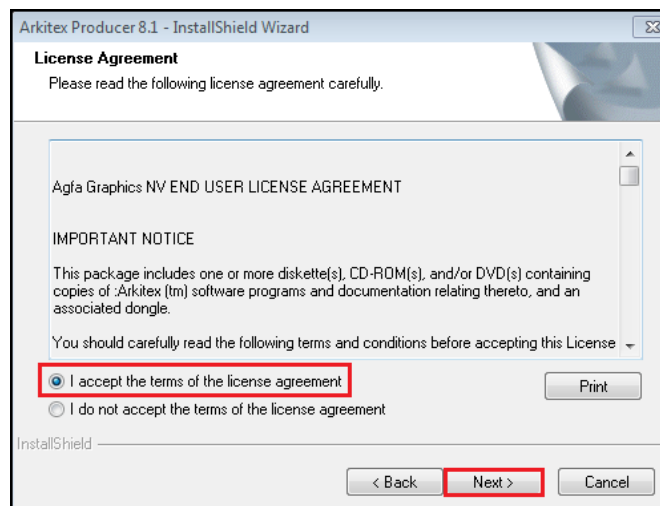

12. Insert the Arkitex Workflow Products DVD into your DVD-ROM drive.

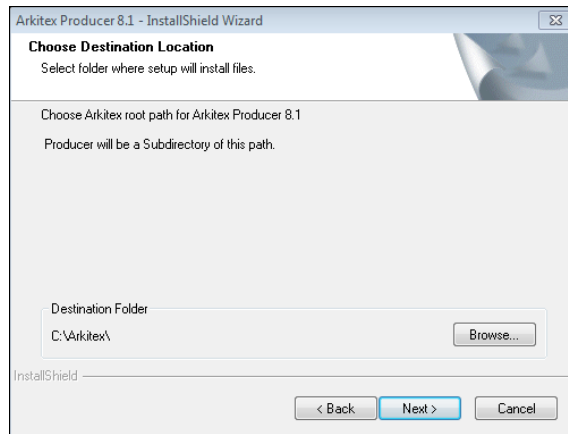

1. At the Arkitek Workflow splash screen, select the Workflow button.
2. Select Arkitek Producer.

3. When the Welcome dialog box is displayed, select **Next** to continue.

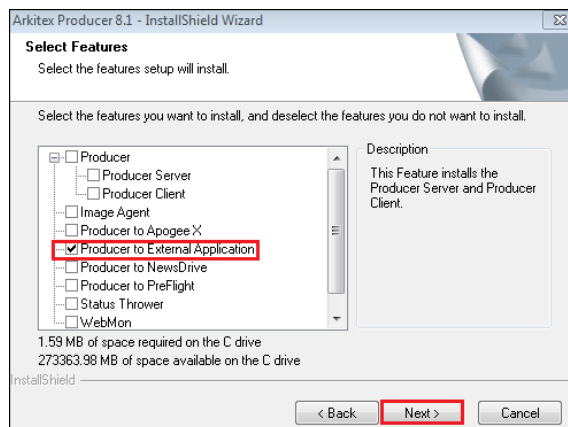

1. At the License Agreement screen, accept the terms. Click Next.

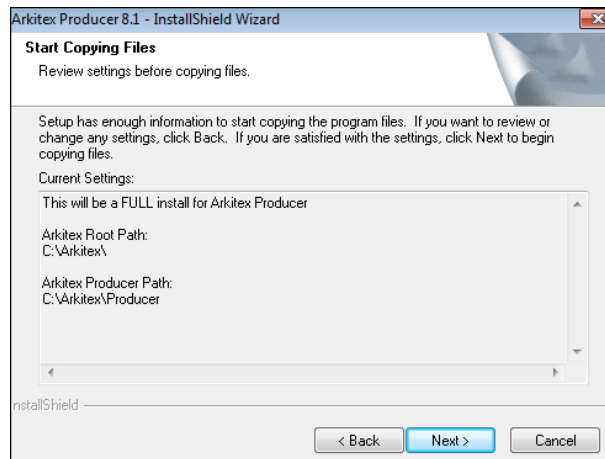

2. To accept the default path, select Next.

NOTE: You may use the default location or you may use Browse to create a new path and file name. Either way, you will be given the choice to create a new folder.

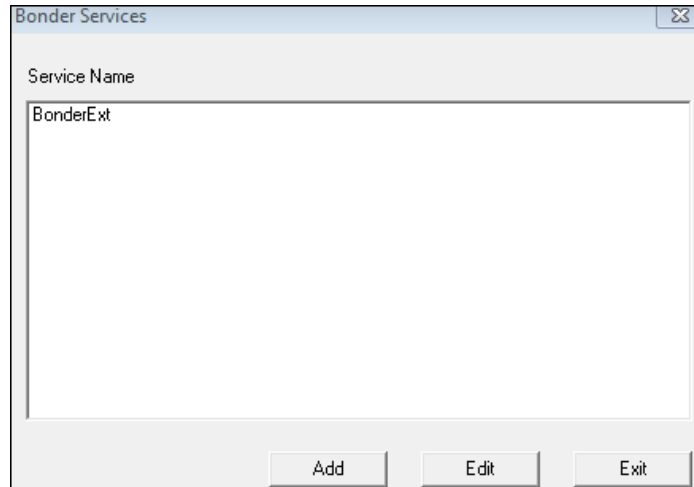

3. Uncheck **Producer** and **Producer Server**
4. Check **Producer to External Application**. Click

5. At the Start Copying Files screen, click Next.

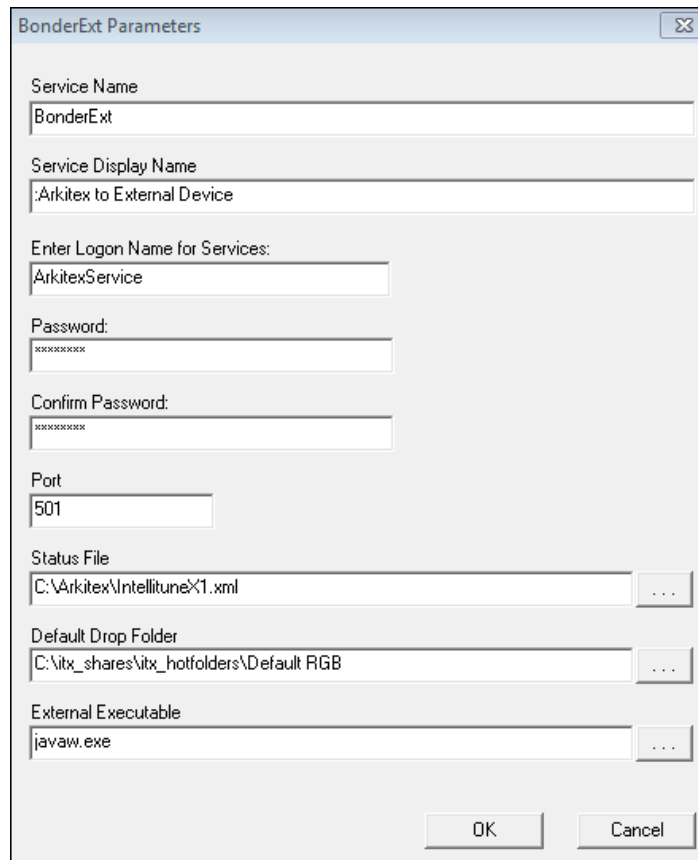

6. The Setup Status screen will displays for awhile.

7. At the **Bonder Services** screen, highlight the **BonderExt** service name, then click **Edit**.

NOTE: After upgrading to IntelliTune/OptiInk System v4 (or above) then the :Arkitex to External Applications Service (BonderExt.exe) may stop accepting data. This is because the required MonitoredExe data value needs to be changed. The old MonitorExe data value was Launcher2W.exe which needs to be changed to **javaw.exe**

The screenshot shows the 'BonderExt Parameters' dialog box. It contains several input fields and buttons. The 'Service Name' field is set to 'BonderExt'. The 'Service Display Name' field is set to ':Arkitek to External Device'. The 'Enter Logon Name for Services:' field is set to 'ArkitekService'. The 'Password:' field is masked with 'XXXXXXXXXX'. The 'Confirm Password:' field is also masked with 'XXXXXXXXXX'. The 'Port' field is set to '501'. The 'Status File' field is set to 'C:\Arkitek\Intellitune\X1.xml'. The 'Default Drop Folder' field is set to 'C:\itx_shares\itx_hotfolders\Default RGB'. The 'External Executable' field is set to 'javaw.exe'. At the bottom, there are 'OK' and 'Cancel' buttons.

8. At the Bonder Parameters screen, change the defaults as follows. Then click **OK**.
9. At the Bonder Services screen, click **Exit**

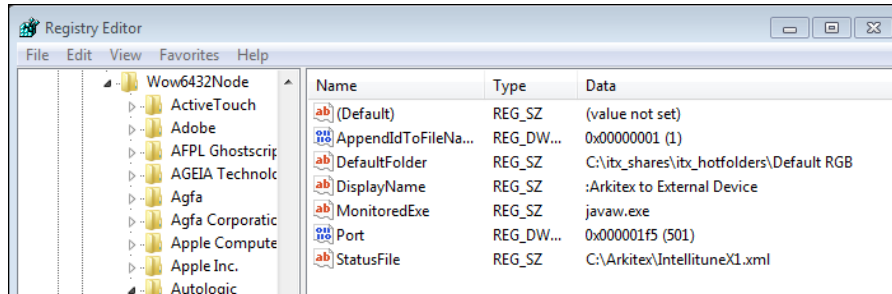

10. Click Finish
11. Type: BonderEXT -service
12. Enter your ArkitekService logon name and password

13. Default settings:
14. Logon name: ArkitexService
15. Password: **!AgfaService1**
16. Confirm password: **!AgfaService1**
17. Browse to the \Arkitex status folder.
18. Browse to your default :IntelliTune/OptiInk drop folder root.
19. Enter javaw.exe. Click **OK**.
20. Click OK. At the Bonder Services screen, click Exit.

Edit the BonderExt registry as follows:

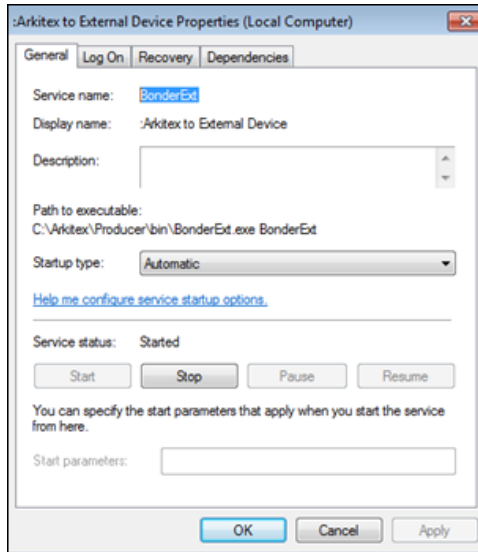

1. Browse to HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Autologic\Bonder\BonderExt.

2. Set the value for AppendIdToFileName to 0.
3. Create a new REG_DWORD called UsePageSetupForSubDir, and set the value to 1.
4. If UsePageSetupForSubDir=1 and ItxDefaultFolder is not an empty string, the page setup name in the logical device will be appended to the drop folder.
5. If UsePageSetupForSubDir=1 and ItxDefaultFolder is an empty string, the page setup name in the logical device will be used as the full path for the drop folder.
6. If UsePageSetupForSubDir=0, then the value of the ItxDefaultFolder registry entry is used.
7. Create your logical devices in Producer where the PageSetup must match the input folder name in IntelliTune/OptiInk.

To Verify Bonder is running as a Service

1. To verify that bonder is running as a service, go to Administrative Tools > Services.
2. Open the Services icon, and locate :Arkitex to External Device in the list.

How to Manually Registering the BonderExt Service

If you ever have to manually register bonder as a service, you will use the command window.

To Register the Service

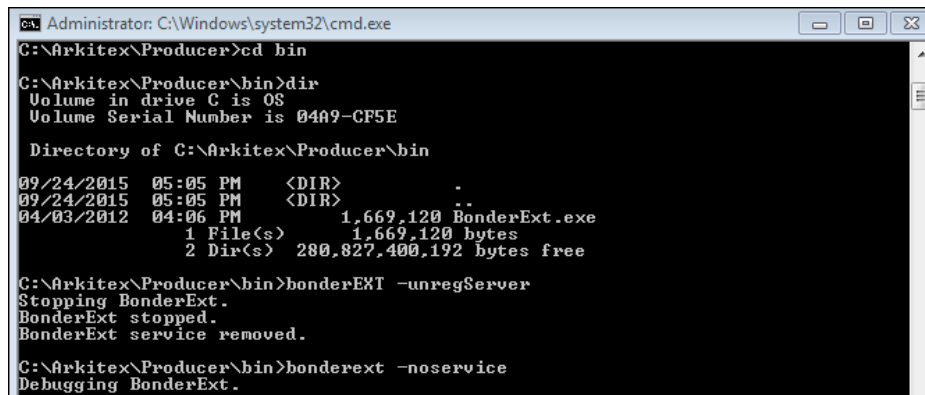

1. Open a command window.
2. Locate the BonderEXT.exe file.
3. `cd : \Arkitex\Producer\bin <ret>`
4. Type in the following command: `bonderEXT.exe -regservice`
5. The window will show that the StartServiceCtrlDispatcher has been called.
6. Now type in this command
7. `bonderext.exe service`
8. When the service is successfully registered, the command window will display that bonder was installed.
9. At the command prompt, enter `services.msc` to display the **Services** window
10. Verify that Bonder appears in **Services**

Run as an Application for Debugging

If you ever need to troubleshoot bonder, you can activate debugging mode.

To Enable Debugging

1. Open a command window.
2. Locate the bonderEXT.exe file.
3. `cd :\\Arkitex\\Producer\\bin <ret>`
4. Type in the following command:
5. `bonderEXT -UnregServer`
6. When the service is successfully unregistered, the following will display in the command window.
7. Bonder service removed

```
C:\Arkitex\Producer>cd bin
C:\Arkitex\Producer\bin>dir
Volume in drive C is OS
Volume Serial Number is 04A9-CF5E

Directory of C:\Arkitex\Producer\bin

09/24/2015  05:05 PM    <DIR>          .
09/24/2015  05:05 PM    <DIR>          ..
04/03/2012  04:06 PM               1,669,120 BonderExt.exe
               1 File(s)              1,669,120 bytes
               2 Dir(s)  280,827,400,192 bytes free

C:\Arkitex\Producer\bin>bonderEXT -unregServer
Stopping BonderExt.
BonderExt stopped.
BonderExt service removed.

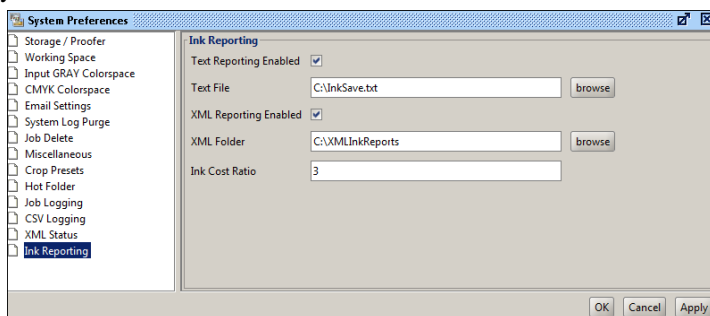

C:\Arkitex\Producer\bin>bonderext -noservice
Debugging BonderExt.
```

8. Type in the following command:
9. `bonderEXT -NoService`
10. This runs as a console application for debugging

9.5 Interface to Arkitex Analyst

The following specifies how to configure IntelliTune to feed data to Arkitex Analyst for reporting.

1. Open System Preferences

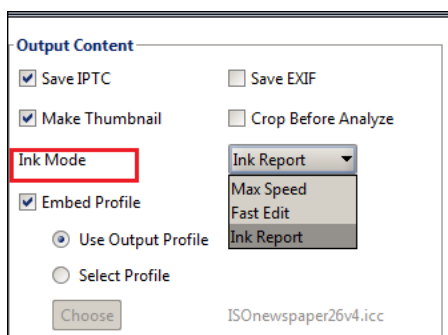

2. To enable Text Reporting click on box to enable by entering a check. This will enable the InkSave.txt file
To enable XML Reporting click on box to enable by entering a check. Creates a folder where the XML files will be stored when jobs are processed. These files are used by Analyst to create reports
3. Click Apply then OK to exit System Preferences

Modify Output Workflow

The Ink Save Calculator must be activated in the Output workflow.

Enable INK Mode

1. Create or Open an Output operation.
2. **Ink Report:** Will prepare the colour managed source file, render both source and result and perform an ink save calculation.
3. **Select Ink Report**

4. **Max speed:** Will optimise performance by doing the minimum rendering and no preparation of colour managed source files.
5. **Fast Edit:** Will prepare the colour managed source file at the same time as processing the result but will do extra rendering.
6. Check Embed Profile
7. Use Output Profile

To Configure Output

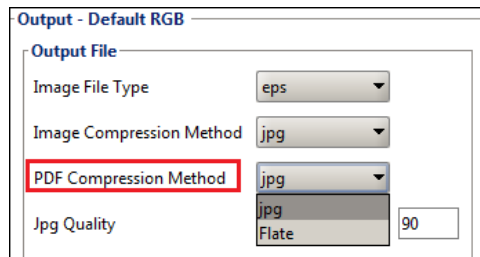

8. Image Filetype – default is original

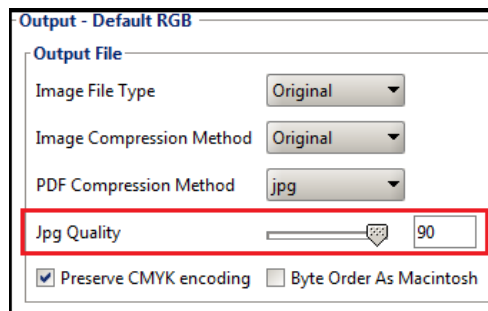

9. Image Compression

10. PDF Compression - ITX or OptiInk

11. Select the PDF Compression Method.

12. Drag the slider until you reach the desired value for Jpg Quality.
 13. Check CMYK jpg saved as CMYK, if necessary.
 14. Check Byte Order as MacIntosh, if necessary.

15. Bit Depth select 8 the default, Same as Input or 16

16. To apply a File Name Mask, enter it in the Mask value box.

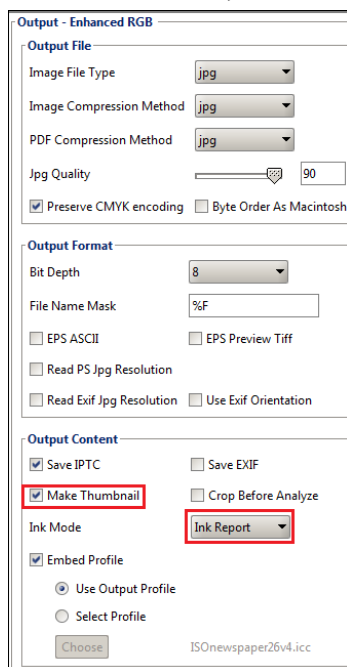

17. Check EPS ASCII, if necessary

18. Check EPS Preview Tiff, if necessary

19. Check Read PS Jpeg Resolution, if necessary.

20. Check Read Exif Jpeg Resolution, if necessary.

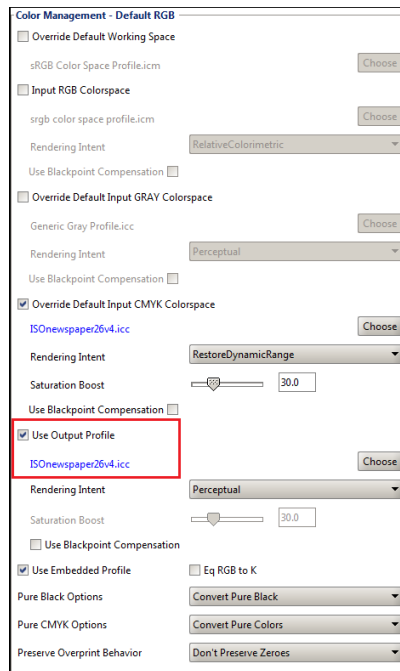

21. Check Use Exif Orientation, if necessary.

22. Check Save IPTC
23. Check EXIF
24. Check the Make **Thumbnail** check box. A **thumbnail** preview is saved together with your image.
The **Make thumbnail** control when enabled will require a render of the result file independent of the Ink Mode control.
25. Check Crop Before Analyze
26. Or click on Select Profile click on The Choose box and select Profile
27. Set the output operation in the desired workflow.

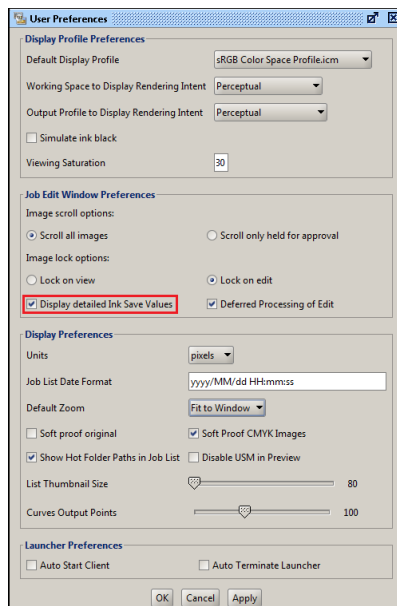

Modify Color management

28. Select Color Management in Workflow you selected
29. Click on Use Output Profile

Modify User Preferences

1. Launch OptiInk, and log in.
2. Open Tools > User Preferences, and check **Display detailed Ink Save Values**.

3. Click OK.

Modify Workflows

1. Select the Workflows tab.
2. Select one of the existing workflows, or create a new workflow.
3. Locate the **GCR** operation, and verify that **Apply GCR** is enabled.

GCR - Coldset_Standard_USM

Verify Location of XMLinkReports Folder

1. Locate the folder XMLinkReports where specified in System Preferences
2. Open one of the XML files.
3. Additional information has been added, Original path, pagecount, image count

Configure Arkitek Analyst

1. Set up Arkitek Analyst to monitor applications to generate reports by configuring the AnalystAgentSettings.properties. Input folders and parsing rules are defined.
2. AnalystAgentSettings.input folder8=\\Analyst_Input_OptiInk or Intellitune
3. AnalystAgentSettings.parsingrule8= OPTIINK or INTELLITUNE
4. The XML files must be placed in the defined Input folder to generate Product Summary and Complete Page Flow Reports.

Pseudo Grace Credit and Protection

1. Pseudo Grace is a mechanism that allows operation of the application if the standard ELMS Licensing system is unavailable for some reason. E.g. if the ELMS service is on another platform and this is turned off, crashes or is unreachable. It is important to recognise that it does not apply if the ELMS system is available even if that system is in Grace or has Grace expired or there is some other licence problem.
2. It works on a system of credit hours. Credit builds up slowly whilst the system is operating normally in a non-graced ELMS environment. Credit only starts building up when a system has been on for at least

3 hours and will build up to a maximum of 14 days. This credit is maintained if the application is stopped or shutdown.

3. Under the conditions where ELMS is unreachable then the system will remain operational operating in a pseudo-grace mode and the credit will decrease accordingly at the rate of 1 minute for each minute of operation. If all pseudo-grace credit is used up the system will stop.
4. If the system goes into pseudo-grace then measures should be taken as soon as possible to investigate why ELMS cannot be reached and corrected.
